1	Halal Integrity in the Food Supply Chain
2	
3	Abstract
4	Purpose: This paper argues that there is an absence of halal integrity within the conventional stages
5	of a food chain. This paper adapts the understanding of the different stages and argues the need to
6	develop a critical consciousness for halal integrity within the food chain to address the needs of the
7	ever-growing Muslim consumers' market. The aim of this paper is to propose a definition of halal
8	integrity using farm to fork and global food supply chain models.
9	
10	Design: The study includes a review of priori literature and media reports regarding cross
11	contamination of food products with haram (forbidden) components. This background will be used to
12	conceptualise halal integrity using farm to fork and a global supply chain models.
13	
14	Findings: Different interpretations of halal – what is permitted and what is prohibited – exist for the
15	different schools of Islamic legal thought and within the customs of different countries. In order to
16	ensure that food production is embracive of the religious needs of the global Muslim customer
17	market, this paper utilises the farm to fork and global supply chain models to foster a critical
18	awareness of halal needs. Halal integrity should be clearly presenting the details of the halal status of
19	the product and assuring that the requirements for halal as stated are met. Halal integrity not only
20	deals with permitted and prohibited foods, but that the halal status of the food products (i.e. from
21	raw materials until it reaches the consumers) should not be breached (i.e. no cross contamination
22	with haram products / methods and no ill intents). A formal definition of halal integrity has been
23	proposed.
24	
25	Research limitations: The SWOT analyses serve as a guideline as the analysis done may be outdated
26	as the environments are constantly changing.
27	
28	Originality/value – This research although academic is meant to have a real value in improving the
29	integrity of the halal food supply chain, providing value to the food industry, to countries that are
30	concerned about this supply chain and to Muslim consumers. Halal integrity is crucial to the success
31	of the emerging halal market.
32	
33	Keywords: food supply chain; halal; halal certification; haram; Islam; Muslims; traceability
34	
35	Introduction
36	Halal is an Arabic phrase for something that is permitted according to Islamic law (Riaz and Chaudry
37	2004). These principles extend beyond dietary requirements and underpin all types of human conduct
38	for adherents of the Islamic faith, including beliefs, actions, diet, clothes, modes of earnings,

39	relationships, etc. The term 'halal' with reference to food covers all the aspects starting from the
40	farm and ending at the table of a halal observant home. Halal food must be free of any components
41	that Muslims are prohibited from consuming, which is known as haram. Based on Qur'anic guidance
42	(Qur'an, 2:168, cited in Chandia, 2015), all foods are halal except those that are specifically
43	mentioned as haram. Haram foods can be divided into several main categories, and include any
44	products derived from or contaminated with these prohibited materials, e.g.such as, carrion, blood,
45	pig, permitted animals slaughtered incorrectly, and intoxicants. Recently, examples of haram
46	contamination and dishonest behaviour with halal certified products highlight (Table 1) areas of
47	concern to Muslim consumers as they are dependent on the food industry and policy makers to
48	assure the integrity of the halal supply chain. Food processors may choose to use pork derivatives,
49	other non-halal slaughtered meats and gelatine to substitute meat products because they are cheap
50	and readily available (Aida <i>et al.</i> , 2005). This raises the question of what is halal integrity and what
51	measures can be taken to assure that products are produced and handled with integrity? The paper
52	aims to provide an eclectic appreciation of relevant sources, critically understand their nuances and
53	implications to bridge the needs of halal integrity within the food chain. This is supported by providing
54	a critical independent analysis which presents an ethical framework that is more embracive of the
55	religious needs of more than 1.5 billion (and ever-increasing) people of the world and (arguably) is
56	very pragmatic for both operational and strategic implementation and monitoringboth local producers
57	and exporters alike. This paper will define halal integrity and attempt to conceptualise the context of
58	halal using the farm to fork and global supply chain models to define halal integrity-develop
59	operational and strategic conceptual frameworks. The frameworks models will assist food
60	manufacturers, food traders and policy makers to ensure the halal integrity of the local and global
61	food supply chains.
62	food supply chains. Insert Table 1 here
63	Insert Table 1 here
64	
65	Methodology
66	A desktop review of priori literature on primary religious and academic sources were conducted.and
67	mMedia reports of cross contamination of halal food products and fraud-related cases were collated
68	to present the data (in-Table 1). The literature research was conducted by using various databases
69	like EBSCO, Science Direct, Taylor and Francis Online and news. Keywords such as pork or porcine
70	detection, halal food, haram and mislabelling were used in the databasesin order to acquire a
71	coherent narrative on emerging themes and trends. This is followed by a critical independent analysis
72	to conceptualise integrity in the context of halal present two conceptual frameworks that are
73	embracive of the religious needs of Muslim customer market.using a farm to fork model and a global
74	supply chain model. SWOT analyses were carried out to demonstrate the internal (i.e. strengths and
75	weaknesses) and external environments (i.e. opportunities and threats) faced during international
76	halal food trade The models are then used to define halal integrity.
ļ	

77	
78	
79	Halal
80	The halal and haram are clear as is seen in a number of Qur'anic verses. Table 2 shows examples of
81	verses related to cating. Some foods, however, are mashbūh (doubtful), which is often the most
82	controversial, since the standards classifying materials as doubtful are more subjective. Examples of
83	permitted, prohibited and mashbūh foods are provided in Tables 3 and 4.

90	
91	Halal food supply chain (operational level)
92	A halal food supply chain starts with sourcing various permitted raw materials and preparing them
93	accordingly (e.g.such as, proper halal slaughter and no cross-contamination with haram products).
94	During all stages of halal production, it is crucial that the food is sourced lawfully, i.e., free from
95	corruption, dishonesty and with no malicious intention (Figure 1). For example, only permitted
96	species are farmed and these halal species do not consume haram feed provided by humans.
97	However, if eaten naturally, then this is not an issue. The schematic diagram below highlights the
98	different stages where halal integrity needs to be considered and preserved (Figure 1).
99	
100	Insert Figure 1 here
101	
102	Many of the major stages found in the food supply chain (Soon and Baines, 2013; Soon et al., 2012)
103	are identified below alongside pertinent notions of halal and its impact on that phase.
104	
105	Agricultural Phase: The inputs (e.g.such as seedlings, plantlets, fertilisers, pesticides, irrigation water,
106	feed, and veterinary products) used during this phase need to be sourced and used according to legal
107	requirements. Irrigation water for produce and crops, drinking water in animal husbandry production,
108	and water sources from where aquaculture products are grown/marine products (including freshwater
109	fish) are caught should be safe and not within the vicinity of pig farms or run-off from pig farms.
110	
111	Slaughtering Phase: It is permitted to slaughter animals without stunning to meet Jewish and Muslim
112	religious requirements (EU, 1993). The slaughtering phase is a key stage as differentiation between
113	halal and non-halal meat occurs at this point (Bergeaud-Blackler 2007). According to Lever and Miele
114	(2012), the practice of religious slaughter in this case addresses the qualification of halal and is

115	comparable to other credence attributes that refer to the method of production rather than the
116	intrinsic characteristics of the product. Hence all operations that occur downstream should guaran
117	the separation and integrity of halal products (Bergeaud-Blackler 2007). For halal it is required to u
118	the Islamic method provided that the animals are slaughtered by a Muslim slaughterman. The Mus
119	slaughter person must be an adult male or female of sound mind familiar with the process of
120	slaughtering. A trained slaughter person will be more efficient and will minimize the damage to the
121	skin and carcass (Riaz and Chaudry, 2004). It is an absolute requirement that animals are
122	slaughtered according to the halal method. The Muslim slaughter person must sever the front part
123	the neck, severing carotids, jugulars, trachea and esophagus without reaching the bone in the nec
124	while pronouncing the name of God and with a swift blow (Riaz and Chaudry, 2004). It is preferab
125	to turn the animal or bird towards Makkah (Mecca) before slaughtering although this is only a
126	secondary requirement. The slaughtering of ruminants and poultry should preferably be done by
127	hand. It is mandatory to pronounce the name of God while slaughtering the animal. It suffices to
128	Bismillah (in the name of God) once (Riaz and Chaudry, 2004). However, in general practice,
129	especially for large animals, the slaughter person pronounces the name thrice as Bismillah Allahu
130	Akbar, Bismillah Allahu Akbar (Riaz and Chaudry, 2004).
131	
132	Processing Phase: This often involves two sub-processes – assembling the materials needed and t
133	actual processing of these materials. All ingredients including processing aids and materials used v
134	food contact surfaces as well as the equipment must be halal, sourced legally, safe, and used
135	according to legal requirements. Packaging and labelling must be clear and honest (i.e., no
136	adulteration or mislabelling) (Ballin <i>et al.</i> , 2009; Ballin, 2010).
137	
138	Storage Phase: It is important that products are stored and segregated from haram products to a
139	cross-contamination. What is acceptable "segregation" is the responsibility of the halal certifying
140	agency. Food packaging (ranging from primary, secondary and tertiary packaging) play a role in
141	ensuring products are kept sealed to reduce potential contamination.
142	
143	Logistics: Throughout the food supply chain, the logistics service provider plays a crucial role in
144	ensuring that the raw materials, ingredients, packaging materials, storage and transportation of h
145	products is done so that they do not become contaminated with haram products.
146	p
147	Audit: The traceability of halal products requires proper tracking of the actual product and
148	certification of its halal status by a local Islamic authority and/or a reputable certification body. Th
149	drive for profit should not lead to compromising of the halal integrity. Although audit can only pro
150	a snapshot of compliance with halal requirements, it is not feasible for any authority to monitor th
150	whole chain, hence the need to have faith in the wholesomeness of the product (Alqudsi, 2014).

2 3 4 5	153 154	Figure 1 illustrates the application of halal integrity at the local operational levelwithin a food production (i.e. animal husbandry, aquaculture) or processing. —However, as the halal food trade and

60		5

Halal Global Supply Chain (strategic level) The question of authenticity is paramount to this debate particularly as the halal food trade and travel increases. The global halal food trade is primarily linked with the rise in the global Muslim population and the increase of transnational trade. In 2010, there were 1.6 billion Muslims with a projected growth to 2.2 billion people by 2030 at an average annual growth of 1.8% (Pew Research Center, 2011). This will make the Muslim population just over one quarter of the world population, representing a 35% increase since 2010. Australia, Canada, Europe and U.S.A. are emerging with growing Muslim populations and as major markets for halal trade and consumption (Algudsi, 2014). The rise in population will undoubtedly boost the growth of the halal consumer market and sales. In 2011, this halal product market was worth a staggering US \$2.3 trillion of which just over 50% of the market (US \$1.4 trillion) was for food and beverages (Ahmad et al., 2011). To be part of the market can be potentially beneficial for non-Muslim countries to have Halal certification and labelling (Demirci et al., 2016; Ruzevicius, 2012). This equated in 2012 to just less than 17% of the global food and beverages market and is projected to rise to US \$1.8 trillion by 2018, capturing approximately 20% of the global market (Arab News, 2016). Further, with the growth of the Muslim population the halal travel industry is projected to grow too. In 2015 the "Muslim travel market was worth US \$145 billion with 108 million Muslim travellers representing 10% of the entire travel economy." This halal tourism market is projected to grow to US \$200 billion by 2020 representing over 13% of the tourism market and this will further increase the need for halal food and beverages (Halal Tourism, 2015).

With the expected growth of the halal food sector, the issue of global sourcing of raw materials and ingredients will require new efforts to assure halal traceability between countries. This is where traceability, identity preservation techniques, and the integrity of the halal certifying bodies can all contribute. As also noted by the Codex Alimentarius Commission (CAC/GL 24 – 1997), the term halal is subjected to different interpretations by the different schools of thought or jurisprudence – particularly Shāf ī, Hanbalī, Mālikī, Hanafī in the Sunni tradition. But they do not differ with respect to haram. The differences between the legal schools of thought revolve around technicalities that must be respected.

It should be noted that there is unanimous agreement regarding what constitutes a most perfect slaughter. This is the requirement for a healthy and alive lawful animal to be slaughtered by a Muslim reciting 'In the name of Allah, Allah is the Greatest' cutting all four tubes or vessels – trachea, esophagus and both external jugular veins, although the question of reversible stunning remains controversial. Beyond the extent of permitted reversible stunning, differences exist about the details of which tubes in the neck need to be cut. Imām Shāfi'ī is of the view that it is obligatory to cut the trachea and the esophagus whilst the dominant view of Imām Mālik is to cut into the trachea and both external jugular veins. Imām Ahmad b. Hanbal has two views reported. One stipulates all four tubes being cut and the other is in agreement with Imām Shāfi'ī. Imām Abu Hanīfā is of the opinion

that three of the four tubes, irrespective of whichever three, should be cut. To this end, there is also
agreement on the cutting point (where the throat meets the upper part of the chest) and the need to
cut a minimum of two tubes (Uthmāni Mufti, 2006).

199 Whilst there are differences regarding secondary details, there is agreement on the need to allow 200 blood to first flow out of the live animal (Regenstein and others 2003; Qu'ran 6:145; Uthmani 2006). 201 Because of these differences, Kamali (2008) suggested the setting up of an international Shariah 202 advisory forum to develop a leadership role in dealing with this issue and similar issues, and to advise 203 on and resolve areas to minimise differences. These types of international standards may assist in the 204 harmonisation and recognition of halal standards. Whilst it would be helpful to achieve some degree 205 of harmonisation and recognition of halal standards, the practicalities are much more complex and 206 can become politicised to where there is an effort to impose a secular view on the religious 207 communities. An example of such an attempt to tell the religious communities that believe in religious 208 slaughter what to do was an EU funded project. The Religious Slaughter: Improving Knowledge and 209 Expertise through Dialogue and Debate on Issues of Welfare, Legislation and Socio-economic Aspects 210 (DIALREL) (www.dialrel.eu) was carried out to provide a platform to share and address issues 211 relating to religious slaughter between stakeholders and interested parties in 2006-2010 (DIALREL 212 2010). But, this attempt was not seen as a dialogue rather it was received as a monologue and 213 imposition of secular thought with limited attention given to religious slaughter practices and 214 engagement with religious communities (Regenstein, 2010).

216 The key to improved halal integrity in international trade is transparency so that consumers can make 217 informed decisions (Algudsi 2014; Farouk et al. 2016). The certifying agency located and supervising 218 in one country must clearly define the standards used for any particular product, especially with 219 respect to slaughter. It must also assure that the company/slaughter/products comply with the 220 standard it has announced. In many cases agencies will certify products using different standards for 221 different countries and thus the certifying agencies need to also be sure to maintain product integrity 222 and only send a product to a receiver under a different certifying agency that meets that agency's 223 standard (Figure 2). Halal standards are used to make halal production more unambiguous (van der 224 Spiegel et al., 2012). Ideally the role of governments as accreditation bodies is to assure that the 225 companies and the certifying agencies are saying what they do and doing what they say. Having 226 governments staying out of certification but focusing on accreditation means that the Muslim citizens 227 in any one country will have access to products that meet their different standards and the certifying 228 agencies can compete to best serve consumers. In practice this generally means that competing 229 certifying agencies tend to help police each other.

230

232

231 Insert Figure 2 here

There are different interpretations of halal by the different schools of thought and these are modified by the customs of different countries. Figure 2 raises the issue of where a local Islamic authority's halal certificate is not recognised by an agency in a different country. Even with the adoption of a standardised or benchmarked halal standard, countries or certification bodies may still choose to remain independent. A certification body such as JAKIM from Malaysia recognises 54 certification bodies from 32 foreign halal certification bodiescountries and 4 authorities but delisted 4 certification bodies (Halal Malaysia Official Portal 2016). But are those rejections based on alternate interpretations of halal, non-compliance with halal requirements, or a political decision? In addition to cross recognition of halal certification bodies, at times local government bodies do not have the resources to carry out inspections globally and are required to outsource responsibilities to Muslim organisations around the world such as Islamic Food Council of Europe (IFCE) and Islamic Food and Nutrition Council of America (IFANCA) to carry out inspections. This triggers a transnational governmentality on a global scale (Fischer, 2016). Thus governments are encouraged to take on the accreditation role to strengthen the whole system, while removing themselves from certification. There are attempts to harmonize halal standards which may benefit the food trade and operational efficiency across countries. Analyses of harmonisation or maintaining independent halal standards will result in different strengths, weaknesses, opportunities and threats. SWOT analyses were divided into two categories in Figure 2 to provide a guideline for countries that opt to select standardised halal standard or choose to have an independent halal standard certification. Countries that opt to use standardised halal standard may benefit from increased cost efficiency and increased food trade. However, there are also threats that there will be reduced variety and freedom of practise according to different schools of thought. Countries that choose to use independent halal standards may benefit from increased competition and the potential to save cost as no benchmarking is required. Meanwhile, although independent halal standards ensure the freedom to adopt halal practices according to their school of thought (and the country's tradition), a reduction in food trade and lack of food choices may prevail. Analyses of harmonisation or maintaining independent halal standards will result in different strengths, weaknesses, opportunities and threats. Hence, Figure 2 is presented as a strategic global halal supply chain model to provide pragmatic information for countries or certification bodies to better serve Muslims with different traditions. However, the SWOT analyses serve as a guideline as Ab Talib and Abdul Hamid, (2014) reported that SWOT analysis done may be outdated as the environments are constantly changing. In addition to relying on halal standards and certification, laboratory analyses can be used to monitor specific haram ingredients in raw materials and food products such as the presence of porcine and alcohol (van der Spiegel et al., 2012), identification of animal species in food (Aida et al., 2005, 2007) and origin of food product (Ebeler, 2007). According to Fauzi and Mas'ud (2009) scientific justification and results of laboratory analyses can provide additional information for local and regional Islamic authorities to evaluate the halal status of the products.

4	272	
5 6	273	One step to better cooperation but while maintaining minor differences related to the schools is the
7	274	halal standard developed by the Turkish Halal Certification Centre (GIMDES) that incorporates
8 9	275	different Schools of Islamic law. A tick ($$) image in the logo can be added beside the appropriate
9 10	276	schools of law (i.e. Shāf ī, Hanbalī, Mālikī, Hanafī) according to which rules the certified company
11	277	has complied (Figure 3). The certification can represent one or even all of the schools of law
12 13		
14	278	(GIMDES, 2015). But given that Turkey is predominantly a Sunni country, to date this form of
15	279	certification does not address the Shi'a schools. It also implies that the application of standards by
16 17	280	schools is sufficient. In some cases, e.g., where ich fish are <u>considered</u> halal, it is apparent that there
18	281	are also different customs in different countries that reflect the different schools but lead to
19 20	282	differences within each school.
20	283	
22	284	Insert Figure 3 here
23 24	285	
25	286	Malaysia recogniszes the significance of halal assurance of food and consumer products produced
26	287	globally. It currently accepts products and premises certified by a number of Islamic certification
27 28	288	bodies and authorities. Globally, JAKIM recognizes 54 foreign halal certification bodies (Halal Malaysia
29	289	Official Portal, 2016). Additionally, JAKIM recognizes <u>4</u> national authorities that will be able to provide
30 31	290	guidance for consumers when purchasing halal goods or patronizing certain premises overseas (Halal
32	291	Malaysia Official Portal, 2016). It should be noted that Malaysia is one of the few Muslim countries
33	292	that recogniszes percussive stunning as acceptable for reversible stunning (Halal Malaysia Official
34 35	293	Portal, 2016).
36	294	
37 38	295	Halal Integrity
39	296	A farm to fork food supply chain is not only concerned about food but also the origin, transparency,
40 41	297	potential for fraud and adulteration, increasing consumers' confidence, traceability (traceback and
41	298	track forward) and quality issues (Hoorfar et al. 2011). Manning and Soon (2014) suggested that the
43		
44 45	299	term food integrity should be used to describe foods that are properly represented for exactly what
46	300	they are. So halal integrity would be again clearly presenting the details of the halal status of the
47	301	product and assuring that the requirements for halal as stated are met. Food safety is part of halal
48 49	302	integrity as wholesomeness (tayyab) is a parallel requirement for halal, i.e., food should be pure,
50	303	lawful and good for human consumption. Zulfakar et al. (2014) proposed a conceptual framework for
51 52	304	halal food supply chain integrity which encompasses protective and preventive measures to ensure
52 53	305	food products remain halal from production until they reach consumers. <u>Halal integrity should also</u>
54	306	demonstrate that the product remain halal throughout the supply chain, are free from any activities
55 56	307	that might breached the halal status (intentionally or unintentionally) (Zulfakar et al. 2012). Others
50 57	308	are proposing more specific halal control points (Kohilavani <i>et al.</i> 2012; Kohilavani <i>et al.</i> 2013),
58		

309	control points for halal slaughtering of poultry (Shahdan et al., 2016) and halal compliance critical
310	control point (Kamaruddin et al. 2012) for various production systems. There are certainly challenges
311	in ensuring halal integrity in the food supply chain as production, processing and transportation
312	require different companies at various stages. Alqudsi (2014) had reported that it is a difficult task to
313	maintain halal integrity of the whole supply chain as it requires constant monitoring and resources in
314	terms of capital and trained staff. However, the demand for halal food products from consumers and
315	the drive from the supply side theory of religion (i.e. expansion of halal markets because of
316	production sides' initiative in creating more halal food) will spur the need to ensure halal food status
317	is maintained. Halal certification bodies play an important role in certifying halal food products and
318	services whilst governments should play an active role as accreditation bodies or to provide
319	independent validation in order to police the halal food chain. If halal integrity is maintained at the
320	operational level across the supply chain regardless of whether the chain is within one country or
321	multiple countries, then one will have a global halal supply chain with integrity (Figure 2). Halal
322	integrity is crucial to the success of the emerging halal market. A formal definition of halal integrity
323	might be articulated as:
324	
325	'the assurance of safe (pure), quality (good) and free from mal-practice (lawful) food from farm to
326	fork'
327	
328	
329	Conclusion
330	The ideas of halal and haram are clear within Islamic teachings. It is important also to understand
331	that halal is a way of life and embraces good conduct and righteous deeds. It is in this context that
332	halal integrity should be understood. This paper utilises the farm to fork and global supply chain
333	models to foster a critical awareness of halal needs. Taking into consideration the origins of food
334	products, production and facilities (i.e. operational level), global sourcing of ingredients and raw
335	materials, food trade and halal as a way of life leads to a definition of halal integrity. SWOT analyses
336	serve as a guideline for countries that opt to select standardised halal standard or choose to have an
337	independent halal standard certification. Countries that opt to use standardised halal standard may
338	benefit from increased cost efficiency and increased food trade while countries that choose to use
339	independent halal standards may benefit from increased competition and the potential to save cost as
340	no benchmarking is required. It is recommended that the key to improved halal integrity in
341	international trade is transparency and required concerted effort from food supply chains, policy
342	makers, halal certification & accreditation bodies and research institutions. Halal integrity is crucial to
343	the success of halal market – if the halal status of the food product is breached (e.g. did not follow
344	halal slaughtering method, cross contamination with haram products, ill intentions), this will render
345	the product haram. In response to the initial questions raised in this paper, i.e., what is halal
346	integrity and what measures can be taken to assure this – a formal definition of halal integrity has

2		
3	347	been proposed. Halal integrity is need both operationally and strategically to ensure that the halal
4	348	status of food products remains intact.
