## Abstract

Purpose: This study explores the dynamics enabling Strategic Account Management (SAM) to function as a value co-creation selling model in the pharmaceutical industry.

Methodology: Using an inductive qualitative research design, data are collected within eleven industry customers in Canada. This work focuses on hospitals as strategic accounts of pharmaceutical companies, exploring SAM value co-creation in the 'hospital-pharmaceutical company' relationship.

Findings: The findings suggest the presence of two key dimensions that can enable a value co-creation SAM model in the hospital-pharmaceutical relationship: 'customer-tailored value-added initiatives' and 'relationship enhancers'. Customer-tailored value-added initiatives explain the activities that are central to the hospital-pharmaceutical company relationship and can lead to the provision of value-added that is unique to the hospital. Relationship enhancers explain the activities that can help strengthen hospital-pharmaceutical company relations in the pursuit of enhanced value-added interactions between the two parties. The research demonstrates a cyclical relationship between 'customer-tailored value-added initiatives' and 'relationship enhancers' leading to value co-creation through a SAM model.

Practical implications: The study informs pharmaceutical industry practitioners on how to improve their value proposition through new, more sustainable selling practices. It offers information in implementing a value co-creation SAM model, which can enable pharmaceutical companies to sustain long lasting value added relationships with key accounts such as hospitals.

Originality/value: The study contributes to the field of strategic account management by conceptualizing SAM as a value co-creation system. It introduces new knowledge in pharmaceutical marketing by offering empirical insight on the applicability and use of SAM in the hospital-pharmaceutical company dyad.

Journal of Business and Industrial Marketing

## 1. Introduction

Over the past decade, the pharmaceutical market has evolved and a direct consequence has been to challenge the sustainability of the model companies employ to market products and services and serve client needs (Patterson, 2008; Payne *et al.*, 2015; Wenzel *et al.*, 2014). The current selling model used by pharmaceutical companies is primarily product-centered. Efforts are directed in creating products and services and then pushing generic offerings to clients (Wenzel *et al.*, 2014) via means such as detailing, sampling, direct-to-consumer advertising, and journal advertising (Hilsenrath, 2011). This has a firm- and product-centric view of value and the process of value creation (Matthing *et al.*, 2004; Johannessen and Olsen, 2010; Prahalad and Ramaswamy, 2004; Vargo *et al.*, 2008), which is increasingly becoming inflexible in accommodating changes in line with the rapidly changing environmental conditions in the pharmaceutical industry: an increasingly competitive environment and especially the changing customer needs and higher client expectations (Klein, 2008; Patterson, 2008; Payne *et al.*, 2015; Wenzel *et al.*, 2014).

Accordingly, in the current environment, drug development and commercialization is a long, costly, and risky endeavor. The cost of bringing a drug from concept to market has increased significantly and in 2014 was estimated to be \$2.6 billion, up from \$802 million back in 2003 (TUFTS, 2014). At the same time, it also takes ten to fourteen years to bring a single drug from concept to market (DiMasi and Grabowski, 2007; Patterson, 2008; Potts *et al.*, 2015), which means that a 20-year patent provides limited time to recoup R&D investment (Patterson, 2008; Wenzel *et al.*, 2014). **As a result**, pharmaceutical companies are financially challenged to make sales the success they once were in the past: it costs more and is riskier than ever to bring a new product to market, and there is less time to recoup the money (DiMasi and Grabowski, 2007;

1  
2  
3 Patterson, 2008; Payne *et al.*, 2015; Wenzel *et al.*, 2014). Consequently, the model utilized to  
4 commercialize and sell products needs to change to reflect better the contemporaneous realities  
5 of pharmaceutical companies. To that end, it is increasingly acknowledged that the selling model  
6 needs to delve beyond product-centered strategies towards approaches that can offer more  
7 flexibility in meeting changing customer needs and ones that can establish long term productive  
8 relationships with key customers (Wenzel *et al.*, 2014). Research on customer-centric selling  
9 models, such as a Strategic Account Management model (SAM) (Gosselin and Heene, 2003;  
10 Gosselin and Bauwen, 2006), is critical in acknowledging alternative means through which  
11 pharmaceutical products and services can be marketed. **The present** study focuses on Strategic  
12 Account Management as a client-centred approach to servicing the client. **SAM is understood** as  
13 a selling model that can help an organisation to delve beyond value embedded in predefined  
14 output (Gosselin and Heene, 2003; Gosselin and Bauwen, 2006; Vargo *et al.*, 2008).

31

32 It is generally agreed, that Strategic Account Management (SAM) reflects a set of  
33 organisational practices directed towards the management of relationships with strategically  
34 important customers (i.e. strategic accounts) (Miller *et al.*, 1992; Storbacka, 2012).  
35 Organisational practices underpinning SAM can, indeed, vary, having as an ultimate goal to  
36 optimise the satisfaction of key clients' needs and expectations (Gosselin and Bauwen, 2006;  
37 Payne *et al.*, 2008; Storbacka, 2012). Despite the presence of diverse evidence and insight on the  
38 content and process of SAM (Gosselin and Bauwen, 2006), **the present study builds on**  
39 understandings that link strategic account management with "value creation" (Anderson, 1995;  
40 Gosselin and Bauwen, 2006; Gosselin and Heene, 2003; Vargo and Lusch, 2008). Value creation  
41 refers to client perceptions of 'use value' and 'exchange value'. According to Bowman and  
42 Ambrosini (2000), value creation is shaped only if customers perceive desirable quality or  
43  
44  
45  
46  
47  
48  
49  
50  
51

57  
58  
59  
60

benefits in products/services in relation to their needs and they are willing to pay an amount to enjoy this value (Bowman and Ambrosini, 2000; Lepak *et al.*, 2007). Specifically, the present article moves a step further to embrace an understanding of value creation as “co-creation” (Prahalad and Ramaswamy, 2004; Lee *et al.*, 2012). This is an understanding of value creation as a process where the interaction between the organisation and the client is becoming the locus of value creation (Prahalad and Ramaswamy, 2004) and engages organisation and client(s) in collaborative and dialogic processes leading to co-creation (Lee *et al.*, 2012). This conceptualisation of strategic account management, understands SAM as a system that locks a seller in a continuous relationship with “key” customers, where higher client engagement allows better understanding of customer needs. This way suppliers become more capable in creating and tailoring desirable products & services that the clients are willing to purchase (Homburg *et al.*, 2002; McDonald *et al.*, 1997; Piercy, 2009; Vargo and Lusch, 2008). In this sense, long term productive relationships with strategically important customers are ensured through efforts directed towards the co-creation and delivery of ongoing value to these customers (Berghman *et al.*, 2006; Cannon and Perreault, 1999; Gosselin and Bauwen, 2006; McDonald *et al.*, 1996, 1997). Hence, the present article treats “value co-creation” as an overarching concept while attempting to understand what can make SAM a value-co creation, and thus a more client-centred, selling model in the pharmaceutical industry.

From an organizational point of view, applying a SAM model is not a process to be taken lightly, as it is not possible to develop a “one-size-fits-all” structure applicable to all situations; hence, companies must comprehend their unique circumstances and dynamics leading to value co-creation and client value added in order to understand the essence and form of their respective account management systems (Georges and Eggert, 2008). Literature on the topic of SAM,

1  
2  
3 though conveying the benefits that pharmaceutical companies can have from its use, offers  
4  
5 insufficient insights on what can make SAM a value co-creation mechanism and thus a valuable  
6  
7 selling model in this industry. As such, the key research question driving this research is the  
8  
9 following:  
10  
11

12  
13  
14  
15 *RQ: "What dynamics are essential for SAM to function as a value co-creation selling*  
16  
17 *model in the pharmaceutical industry?"*  
18  
19

20  
21  
22 'Dynamics' in the context of **the present study**, is understood to denote the conditions and  
23  
24 forces which can stimulate development within a system (Lewin, 1945). In this sense, **the present**  
25  
26 **work** is set to investigate the developmental conditions and forces that can allow SAM to  
27  
28 become and function as a value co-creation system. The parameters of this study are limited to  
29  
30 the large branded pharmaceutical industry (excluding generic manufacturers) in the Canadian  
31  
32 marketplace.  
33  
34

35  
36 In line with previous work, **this article focuses** on hospitals as strategic accounts of  
37  
38 pharmaceutical companies (Wartenberg and Gores, 2008), exploring SAM value co-creation  
39  
40 dynamics in the context of the hospital-pharmaceutical company **relationship**. The next section  
41  
42 offers a review of literature around Strategic Account Management and its relation to value  
43  
44 creation and the pharmaceutical industry, followed by a description of the research methods  
45  
46 employed. The remaining sections offer an analysis and discussion of the data collected from  
47  
48 various hospitals in Canada, as well as the conclusions, contributions, and implications from the  
49  
50 study.  
51  
52  
53  
54

58  
59  
60

## 2.1 Strategic Account Management (SAM)

Strategic Account Management (SAM) involves a sequence of organisational practices that allow a business to establish fruitful long-term relationships with strategically important customers (Miller *et al.*, 1992; Storbacka, 2012). Early work focused on 'key account management' in efforts to stress the importance of establishing close relations with the few customers which are vital to an organisation's existence (McDonald, 1996, 1997). McDonald (1997) defined key account management 'an approach adopted by companies aimed at building a portfolio of loyal accounts by offering them, on a continuing basis, a product/service package tailored to their individual needs'. Subsequent research, progressively established the notion of 'Strategic Account Management' as a means to emphasise the strategic importance of key account management (Al-Husan and Brennan, 2009; Gosselin and Bauwen, 2006; Gosselin and Heene, 2005). 'Strategic Account Management' (SAM) involves pro-active approaches and sufficient planning behind the management of relationships with key customers, as opposed to reactive moves resulting from competitive practices or changing customer demands. This way, SAM becomes a strategic tool and can contribute to an organisation's unique selling position and efforts to establish a competitive advantage (Gosselin and Heene, 2005; Ivens and Pardo, 2007; Pardo *et al.*, 2006).

SAM, usually involves a business-to-business relationship, where relevant strategic account managers employed at a selling company are assigned to serve and interact with particular business clients (Gosselin and Heene, 2005 McDonald, 1996, 1997). Strategic account managers play a critical mediating role in a business' efforts to establish long-lasting relations with strategically important customers: they represent the selling company's capabilities to the buying

1  
2  
3 company and the buying company's needs to the selling company (McDonald, 1996). Empirical  
4  
5 insight on the role of strategic account managers, suggests that these individuals fulfill the role of  
6  
7 an enabler or promoter of an existing supplier-customer relationship (Bacon, 1999). Their task is  
8  
9 also about minimizing the friction within the relationship and optimizing the fit between the  
10  
11 supplier's value offer and customer's needs (Weitz and Bradford, 1999).  
12  
13  
14

15 Interestingly, Gosselin and Bauwen (2006) identified a number of different sources of  
16  
17 confusion in the comprehension of strategic account management, and argued that a company's  
18  
19 understanding of the differences will contribute to the enhancement of their capabilities to create  
20  
21 competitive advantages (based on the creation of customer value). The most important and  
22  
23 relevant source of confusion posed was the following: Is it possible to design and implement a  
24  
25 single best strategic account management organisational structure, applicable to most types of  
26  
27 companies and customers and independent of the complexities of the market (Gosselin and  
28  
29 Bauwen, 2006)? The simple answer is no, based on the fundamental organizational theory, the  
30  
31 congruency principle (Donaldson, 2001; Mackenzie, 2003; Miles and Snow, 1994), which  
32  
33 denotes that it is impossible to design a universal and single best strategy, applicable to all  
34  
35 possible situations (Gosselin and Bauwen, 2006). The take-away message from their research is  
36  
37 that an account can only be categorized as "strategic" if both the customer is open to a  
38  
39 relationship and the supplier has the ability to develop the competencies required to making the  
40  
41 relationship work. They argue that this concept is integral to the establishment of a SAM model  
42  
43 in any industry, and pertinent to this research.  
44  
45  
46  
47  
48  
49

50 Ojasalo (2001) proposed certain characteristics to describe the general nature and essence of  
51  
52 the SAM approach (see table 1). These findings allow recognizing essential elements to Strategic  
53  
54 Account Management: the SAM model is based on long term relationships with selected clients,  
55  
56  
57  
58  
59  
60

1  
2  
3 it is established mostly in business-to-business markets, and finally, it is critical for fulfilling a  
4  
5 business' profitability and shareholder value goals (Ojasalo, 2001). These elements have been  
6  
7 considered in the context of the present paper to establish the profile of customer relationships  
8  
9  
10 sought to research for gaining insight on the applicability and use of SAM in the Pharmaceutical  
11  
12 industry (more details on the research approach is offered in the Methodology section).  
13  
14

### 15 *Insert Table 1*

16  
17 Studies around SAM offer diverse understanding on the conditions and dynamics leading to  
18  
19 SAM implementation and functioning within organisations. Ojasalo (2001) proposed that SAM  
20  
21 implementation and functioning consists of four basic elements: (1) identifying the key accounts  
22  
23 through a number segmentation variables – criticality, quantity, replaceability, slack, (2)  
24  
25 analyzing the account on levels such as basic characteristics, relationship history, the level  
26  
27 commitment to the relationship, goal congruence of the parties, and switching costs, (3) selecting  
28  
29 suitable strategies based on the power positions of the seller and the account, and finally, (4)  
30  
31 continuously developing and customizing operational-level capabilities to enhance the  
32  
33 relationship on levels such as products & services, organizational structure, information  
34  
35 exchange, and personnel allocated to the account. ALHussan *et al.* (2014), in turn, identified a  
36  
37 number of environmental-specific factors that are likely to affect SAM implementation,  
38  
39 including the intensity of competition and ownership structure; product and customer  
40  
41 complexity; Western influences (education, training, experience, expatriation); and institutional  
42  
43 and cultural influences. Abratt and Kelly (2002) shed light on a different set of factors including  
44  
45 knowledge and understanding of the key account customer's business; proper implementation  
46  
47 and understanding of the SAM program; commitment to the SAM program; suitability of the key  
48  
49 account manager; and the level of trust between supplier and customer. Workman *et al.* (2003),  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 in turn, explain that SAM success depends on SAM team esprit de corps, access to marketing  
4 and sales resources, activity intensity and proactiveness, and top management involvement in  
5  
6  
7  
8 SAM.  
9

10  
11 Despite the exploration of dynamics underpinning SAM implementation and functioning, it  
12 is increasingly understood that convergence into a common framework underpinning SAM is not  
13 possible. This is because the context has a strong influence on SAM implementation and this  
14 practice may be seen and applied differently in different companies, industries, and countries  
15 (ALHussan *et al.*, 2014). Acknowledging these limitations, the present paper offers fresh insight  
16 on SAM implementation and functioning from contexts in which SAM is relatively under  
17 researched. This is the pharmaceutical industry in the Canadian economy.  
18  
19  
20  
21  
22  
23  
24  
25  
26

27  
28 Further, while there is interest in researching and discussing the critical prerequisites of SAM  
29 implementation and functioning, the majority of previous work treats SAM as a supplier/seller-  
30 driven approach (Gosselin and Bauwen, 2006; Guenzi *et al.*, 2009; Sullivan *et al.*, 2012),  
31 underpinned by a firm-centric view of value creation (Matthing *et al.*, 2004; Johannessen and  
32 Olsen, 2010; Prahalad and Ramaswamy, 2004; Vargo *et al.*, 2008). More recent work presents  
33 SAM as a means to co-create value with the customer. If SAM is directed towards higher client  
34 engagement and co-ownership of the process leading to value creation, then this can help  
35 strengthen the quality of and value added from supplier-customer interactions (Lee *et al.*, 2012;  
36 Prahalad and Ramaswamy, 2004). The next part sheds light on SAM as a value co-creation  
37 approach, and sets the scene for the focus of this paper (i.e. the dynamics that can allow SAM to  
38 function as a value co-creation selling model in the pharmaceutical industry).

Though limited, previous research has explored the links between strategic account management and value creation (Gosselin and Bauwen, 2006; Gosselin and Heene, 2003; Vargo and Lusch, 2008). Value creation is understood as an outcome of both ‘use value’ and ‘exchange value’ (Lepak *et al.*, 2007). In this sense, value creation is shaped only if customers perceive desirable quality or benefits in products/services in relation to their needs and they are willing to pay and amount to enjoy this value (Bowman and Ambrosini, 2000; Lepak *et al.*, 2007). This conceptualisation of strategic account management, looks into SAM as a system that locks a seller in a relationship with “key” customers to allow thorough understanding of customer needs with the view to create and tailor desirable products & services that the clients are willing to pay to enjoy (Homburg *et al.*, 2002; McDonald *et al.*, 1997; Piercy, 2009; Vargo and Lusch, 2008). This way, long term productive relationships with strategically important customers are ensured through efforts directed towards the creation and delivery of ongoing value to these customers (Berghman *et al.*, 2006; Cannon and Perreault, 1999; Gosselin and Bauwen, 2006; McDonald *et al.*, 1996, 1997). According to Gosselin and Bauwen, (2006), SAM is a system for creating and maintaining customer value with important customers and thus creating a competitive advantage based on value creation. Since SAM allows close customer-supplier collaborative relationships, it can make the focus on customer value more evident (Anderson, 1995; Anderson and Narus, 1990; Gosselin and Bauwen, 2006).

A recent extension on value creation refers to the co-creation of value between a company and a client (Ramaswamy, 2011). ‘Value co-creation’ is “the process by which mutual value is expanded together” (Ramaswamy, 2011, p. 195). According to Prahalad (2004), value co-creation allows “moving away from the old industry model that sees value as created from goods and services to a new model where value is created by experiences”(p. 172). Value co-creation is

1  
2  
3 increasingly understood to reflect the future of value creation in organisations (Lee *et al.*, 2012;  
4 Vargo *et al.*, 2008). It establishes a new model where the interaction between the organisation  
5 and the client is becoming the locus of value creation (Prahalad and Ramaswamy, 2004). Thus,  
6 value co-creation reflects even a more customer-driven perspective, which can help shape more  
7 meaningful experiences for the customers since it allows them to co-create with a firm the  
8 products and/or services that they purchase (Prahalad, 2004; Prahalad and Ramaswamy, 2004).  
9  
10  
11  
12  
13  
14  
15  
16

17  
18 Therefore, given the embeddedness of SAM in close customer-supplier relations, strategic  
19 account management may be approached and promoted as a value co-creation model, which can  
20 allow better flexibility in meeting complex and even individualistic customer needs and in  
21 establishing relevant competitive advantages through customer experience maximisation  
22 (Wenzel *et al.*, 2014). SAM, in this sense, becomes a dialogic processes leading to co-creation  
23 (Lee *et al.*, 2012); interactions with clients acquire more centrality and organisational practices  
24 focus on the co-creation of products, services, and/or experiences in line with each client's  
25 peculiar circumstances (Lee *et al.*, 2012; Prahalad and Ramaswamy, 2004).

36  
37 **The present work** focuses on the pharmaceutical industry which is a manufacturing and  
38 product driven sector, and a context where products and services are often shaped and pushed to  
39 customers (Wenzel *et al.*, 2014). Value creation as co-creation could be a means through which  
40 pharmaceutical companies could improve the satisfaction and experience of the customer and,  
41 therefore, establish sustainable competitive advantages. The section that follows reviews  
42 literature regarding the existing drug selling model of pharmaceutical companies. It also  
43 discusses previous work exploring SAM within the pharmaceutical sector, with the view to set  
44 the scene on the phenomenon that this study is set to investigate; *i.e. the dynamics that are*

### 10 **2.3 SAM in the Pharmaceutical industry: Towards client driven and value added relations** 11 **with customers**

12  
13  
14  
15  
16 *The traditional approach to sales*

17  
18 In the pharmaceutical sector price is not the primary focus of firm efforts to commercialise  
19 new drugs, but rather the unique qualities of the product, the better health outcomes, or the  
20 optimal convenience or agreeable treatment (Hilsenrath, 2011). In recent years, the  
21 pharmaceutical selling model has relied primarily on four approaches: detailing, providing  
22 samples, direct-to-consumer (DTC) advertising, and journal advertising (Hilsenrath, 2011).

1  
2  
3 shape and communicate value to health care professionals, as opposed to the engagement of the  
4  
5 client in the value creation process (Chimonas *et al.*, 2007).  
6  
7

8 Recent evidence sheds light on the saturation of detailing as a selling model (Hilsenrath,  
9  
10 2011; Morgan, 2010). A key explanation is that health care professionals such as physicians are  
11  
12 not motivated to engage in relations with pharmaceutical representatives, since they may not see  
13  
14 such interactions as value added anymore (Hilsenrath, 2011; Morgan, 2010). Hence, companies  
15  
16 within the pharmaceutical industry need to evolve their model rapidly if they want to remain  
17  
18 profitable, and hence continue to look for innovative approaches to market their products that  
19  
20 will provide them with a long-lasting competitive advantage.

### 27 *Towards value co-creation through SAM*

28

29 Although a plethora of books and journals exist on the topic of SAM, very few of the ideas  
30  
31 and concepts generated in the literature address medical markets specifically; the peer-reviewed  
32  
33 academic literature on the SAM business model within pharmaceutical companies is scarce.  
34  
35

36 Smith (2009) looked into the applicability of SAM in pharmaceutical markets and proposed a  
37  
38 number of critical elements to consider when adopting a SAM model in pharmaceutical  
39  
40 companies: (1) *SAM depends on effective targeting*: beyond the typical volume criteria, key  
41  
42 accounts must also be able to deliver non-financial-value and, critically, be willing and able to  
43  
44 enter into a relationship. “In many therapy areas, the clinician/purchaser power balance is still  
45  
46 such that the organisation (i.e. hospital/account) is unable to act as an entirety” (Smith, 2009, p.  
47  
48 92), or even when it is possible, the internal culture of the customer organization hinders them  
49  
50 from entering into long-term, mutually trusting relationships because their history and habits  
51  
52 predispose them towards transactional, almost confrontational, relationships with suppliers. (2)  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 *SAM requires rare knowledge assets:* Strategic account management usually depends on the  
4 supplier having superior knowledge of and superior relationships with the customer at all levels  
5  
6 of the organisation (Smith, 2009). (3) *SAM requires organisational change:* The traditional  
7  
8 hierarchical structure observed in pharmaceutical sales organograms, designed to maximize  
9  
10 efficiency and control, where short-term results are a priority and where political game playing is  
11  
12 frequent, is rarely appropriate for SAM: nowhere is the old adage “structure follows strategy”  
13  
14 (Chandler, 1990) more true than with the SAM model. Successful SAM functioning requires  
15  
16 innovative reporting structures that are often account-specific (Smith, 2009). (4) *SAM requires*  
17  
18 *different approaches to measurement:* The multidimensional nature of “value creation” in SAM  
19  
20 is fundamentally different to the goals in a traditional sales model, and this implies that similarly  
21  
22 sophisticated Key Performance Indicators (KPI’s) must be put in place. Lag indicators of sales,  
23  
24 profit and market share need to be replaced with a broader range of qualitative and quantitative  
25  
26 KPI’s that both lead and lag outcomes. Again, such a shift in thinking is a cultural paradigm shift  
27  
28 for most pharmaceutical companies (Smith, 2009). (5) *SAM requires organizational learning:*  
29  
30 SAM requires a company to constantly test what is being done against its value generation and  
31  
32 relevance. If a pharmaceutical company thrives on a product-led culture, the implementation will  
33  
34 be more arduous, whereas open, learning organizations will be more successful (Smith, 2009).  
35  
36  
37  
38  
39  
40  
41  
42

43 Another interesting paper on SAM in the pharmaceutical industry by Vanderveer (2002)  
44  
45 discusses the dynamics of this business model and its all-around value. Vanderveer’s (2002)  
46  
47 recommendations have merit in that they do bring up the concept of value creation, but overall  
48  
49 lack specificity and cohesion in terms of theoretical modelling. His research presents a credible  
50  
51 argument to support account management as the way of the future for pharmaceutical companies,  
52  
53 but does not offer a recommendation on how to actually implement such a model.  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 While strategic account management is an under-researched area in relation to the  
4 pharmaceutical industry, very few studies have explored SAM in this industry in relation to  
5 value-creation; i.e. the way relations with clients allow companies to create products and  
6 propositions that convey value to the client (Storbacka, 2012; Vanderveer, 2002; Vargo and  
7 Lusch, 2008). Value creation could help explain the conditions under which pharmaceutical  
8 companies could offer better added value in their interactions with their key clients.  
9

10  
11 The pharmaceutical industry needs to depart from the traditional selling model (e.g.  
12 detailing), which centres primarily on generic value propositions. Value co-creation could be a  
13 means through which this industry can improve the added value of their offerings to achieve  
14 better customer satisfaction and loyalty. The present study focuses on SAM as a means through  
15 which value co-creation can be established (Storbacka, 2012; Vargo, *et al.*, 2008).  
16  
17

18  
19 The present study is set to investigate the dynamics that are essential for SAM to function as a  
20 value co-creation selling model in the pharmaceutical industry. This research is carried out  
21 within the branded pharmaceutical industry in Canada. This is a context which can help offer  
22 fresh insight into our understanding of SAM as a value co-creation model in the hospital-  
23 pharmaceutical company interexchange.

### 43 3. Methodology

44  
45 For pharmaceutical companies, institutional customers like hospitals are ideal partners with  
46 whom to implement a SAM model. Indeed, the literature states that one of the market  
47 environment conditions historically associated with a shift to a SAM approach is the increased  
48 sophistication of the buyer (Gosselin and Heene, 2005); given that institutional customers like  
49 hospitals are seeing an emergence of increasingly complex stakeholder networks and decision-  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 making processes (Wartenberg and Gores, 2008), there is solid theoretical ground for  
4  
5 pharmaceutical companies to focus on hospitals as strategic accounts.  
6  
7

8 To that end, and given the efforts to research the dynamics for SAM to become a value co-  
9  
10 creation model, data was collected within hospitals as (potential) strategic accounts of  
11  
12 pharmaceutical companies. Given the focus on the customer, the study sheds light on the  
13  
14 customer (i.e. hospital) perspective of SAM as a value co-creation system (as opposed to a more  
15  
16 holistic understanding that would bring together the views of both parties in the relationship). In  
17  
18 pursuing insight on this relatively unexplored phenomenon, a case study research method was  
19  
20 adopted (Eisenhardt, 1989; Eisenhardt and Graebner, 2007; Yin, 2013). Particularly, a multiple  
21  
22 case study research was employed (Eisenhardt, 1989; Yin, 2013), each case representing a  
23  
24 different hospital. The organization was considered as a unit of analysis due to the focus on the  
25  
26 hospital needs and expectations in its business relations with pharmaceutical companies.  
27  
28 Multiple case study research allowed conducting cross-case pattern search, investigating the  
29  
30 evidence through multiple lenses, and obtaining a saturated understanding of the phenomenon at  
31  
32 hand (Eisenhardt, 1989; Eisenhardt and Graebner, 2007). These processes enabled identifying  
33  
34 patterns, themes, and relationships replicated across cases (Eisenhardt, 1989; Yin, 2013), helping  
35  
36 to build theoretical understanding that would generalize across the participating cases  
37  
38 (Eisenhardt, 1989).  
39  
40  
41  
42  
43  
44

45 To identify relevant cases, purposive sampling (Bryman and Bell, 2015; Morse, 2004) was  
46  
47 used; i.e. hospitals were chosen (purposefully) so that these would reflect a diverse blend of  
48  
49 varying types of hospitals in Canada, ranging from small to large, academic to community-based.  
50  
51 This was done in order to drive a true representation of the Canadian healthcare environment.  
52  
53 This would ensure a saturated understanding of the phenomenon under investigation and secure  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 efforts to build a theoretical framework that would generalize across the participating  
4  
5 organizations (Eisenhardt, 1989; Eisenhardt and Graebner, 2007; Yin, 2013).  
6  
7

8 The reasoning that was used to carry out and make meaning out of multiple case study was  
9  
10 mainly inductive (Bryman and Bell, 2015; Yin, 2013). Despite carrying out a loose assumption  
11  
12 on SAM as a value co-creation model, the authors of the present study have investigated the  
13  
14 phenomenon in an open manner allowing the research participants to elaborate fully on their own  
15  
16 understanding on how a client-supplier (in this case a hospital-pharmaceutical company)  
17  
18 relationship could become fruitful and value added. Given the ‘customer perspective’ of the  
19  
20 study and the consideration of hospitals as strategic accounts of pharmaceutical companies, the  
21  
22 research participants were asked to recall relationships of their hospital with any pharmaceutical  
23  
24 company (not one specific relationship). Thus, the research participants have addressed several  
25  
26 different suppliers (i.e. pharmaceutical companies) during the interviews.  
27  
28  
29  
30  
31

32 In-depth interviews was the key instrument employed to gather relevant data from each case  
33  
34 (Yin, 2013). To obtain the information needed to build a theoretical framework relevant to the  
35  
36 dynamics underpinning SAM as a value co-creation model (in the pharmaceutical industry),  
37  
38 interviews were conducted with hospital directors. To ensure a strong cross-representation of the  
39  
40 important decision makers within a hospital setting, numerous levels of senior management were  
41  
42 approached (in this case: CEO, VP, Pharmacy Director, and Medical Director). While initially a  
43  
44 single interview took place with a key decision maker in each hospital, subsequent visits to the  
45  
46 research sites led to the collection of data from an additional decision-maker. This was done to  
47  
48 ensure a more rounded understanding of the phenomenon within each participating organization,  
49  
50 in line with the case study methodology (Yin, 2013). In total, twenty-two hospital directors were  
51  
52 interviewed, representing eleven hospitals. Table 2 outlines basic characteristics of each of the  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 participants and their respective organizations (i.e. hospitals). Interest in participating in the  
4  
5 qualitative research was solicited partly through the Canadian College of Health Leaders.  
6  
7  
8  
9

10  
11 *Insert Table 2*  
12  
13  
14

15 The interviews were approached from a flexible, facilitative and open-ended position, to  
16  
17 allow sufficient elaboration on the topic in line with the need to gather relevant emergent  
18  
19 understanding for theorization purposes (Eisenhardt and Graebner, 2007). Since a customer  
20  
21 perspective was pursued, the aim was to design a customer-centric interview guide. Thus, the  
22  
23 overarching phenomenon and interview topics were introduced in a language that would enable  
24  
25 the research participants to comprehend fully the areas of discussion. For example, interviewees  
26  
27 were not asked to discuss directly topics such as SAM or value co-creation. Instead they were  
28  
29 asked to discuss the relationships of their organizations with pharmaceutical companies, areas of  
30  
31 hospital-pharmaceutical company relations being critical to hospital functioning, understandings  
32  
33 for improved hospital benefits from such relations, suggestions on how to make such relations  
34  
35 enduring, etc. A pilot study was conducted within one hospital (two interviews) to test the initial  
36  
37 interview guide. Following the pilot, additional refinements led to the design of a research  
38  
39 instrument that was closer to the language and understanding of the research participant and  
40  
41 would allow eliciting all necessary information on the study's phenomenon.  
42  
43  
44  
45  
46  
47

48 No prior theoretical lens was imposed and efforts were centered on emergent insight and  
49  
50 emergent relationships, which would set the grounds for a new theory on the phenomenon at  
51  
52 hand (Eisenhardt, 1989; Eisenhardt and Graebner, 2007; Yin, 2013). In analysing the data, an  
53  
54 inductive coding process was employed to allow linking and incrementally proceeding from data  
55  
56  
57  
58  
59  
60

1  
2  
3 to theory (Corbin & Strauss, 2008). Initially, open coding was used as a means of identifying,  
4  
5 relevant to the topic, concepts and themes. Subsequent rounds of axial coding allowed in  
6  
7 understanding relationships between initial codes and themes and larger categories underpinning  
8  
9 the meaning of the data (Corbin and Strauss, 2008; Miles and Huberman, 1994). All the study's  
10  
11 key themes emerged inductively as part of the inductive coding process that was employed,  
12  
13 without any prior consideration of existing literature. Key themes and sub-themes (e.g.  
14  
15 'customer-tailored value added initiatives', 'tangible benefits to hospitals', 'value linked to QIP  
16  
17 Goals' etc) were first identified, then linked between them, and then the authors moved on to  
18  
19 review existing literature to get a sense of new and existing concepts reflected in the findings  
20  
21 (Gioia *et al.*, 2013). It was after linked to literature (Gioia *et al.*, 2013) that the authors of this  
22  
23 article understood how their research would contribute to the fields of 'strategic account  
24  
25 management' and 'pharmaceutical marketing'.  
26  
27  
28  
29  
30  
31

32 Through interpretative analysis (Moisander and Valtonen, 2011), the interview responses  
33  
34 were used to derive an understanding on how relationships in the hospital-pharmaceutical  
35  
36 company interexchange can become more meaningful and value added. Participants' meanings  
37  
38 had a central role in the analysis and presentation of findings, as well as on the conceptualisation  
39  
40 of emergent concepts and relationships.  
41  
42  
43  
44  
45

#### 46 **4. Results**

47  
48 Two concepts have emerged from this research, which appeared to shed light on the  
49  
50 dynamics allowing SAM to become and function as a value co-creation selling model in the  
51  
52 pharmaceutical industry. First, the 'customer-tailored value-added initiatives' will be explored in  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 detail, followed by a review of the ‘relationship enhancers’ in the hospital-pharmaceutical  
4  
5 company interexchange, as reported by the customers themselves.  
6  
7  
8  
9

#### 10 *4.1 Customer-tailored value-added initiatives in the hospital-pharmaceutical relationship*

11  
12 As emerged from the findings, ‘customer-tailored value-added initiatives’ are important in  
13 making SAM a value co-creation selling model in the pharmaceutical industry. These initiatives  
14 refer to actions on behalf of a supplier (in this case the pharmaceutical company) that focus on  
15 the specific needs of a client (i.e. the hospital) and lead to the creation of unique value for this  
16 client. As articulated by the research participants, hospitals are in need of relationships with  
17 suppliers (i.e. pharmaceutical companies), which embed initiatives that can help generate value  
18 that suits their individualistic needs and idiosyncratic contexts.  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 More particularly, the findings suggest two dimensions of value-added initiatives, which can  
30 allow the customer-tailoring of value to take place. These include: *a) Initiatives that generate*  
31 *value linked to Annual Quality Improvement Plans*, and *b) Tangible benefits that are very*  
32 *specific to the realities and context of each hospital*. These dimensions are explained in more  
33 detail in the sections that follow.  
34  
35  
36  
37  
38  
39  
40  
41  
42

##### 43 *4.1.1 Customer value linked with Quality Improvement Plan (QIP) goals*

44  
45 Key organizational goals of hospitals in Canada are reflected in their respective Quality  
46 Improvement Plans. The Excellent Care for All Act (ECFAA) requires that hospitals develop an  
47 annual Quality Improvement Plan (QIP) for the following fiscal year and make that plan  
48 available to the public. The QIPs are an opportunity to highlight a hospital’s goals, which mainly  
49 revolve around the following needs: delivering high quality health care, creating a positive  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 patient experience, ensuring that it is responsive and accountable to the public, holding its  
4  
5 executive team accountable for its achievement, and being transparent (Ontario Ministry of  
6  
7 Health, 2012).  
8  
9

10 The research participants explained the central role that QIPs hold in the relationship  
11  
12 between a hospital and a pharmaceutical provider. As explained, since QIPs are an adequate  
13  
14 reflection of hospital individualistic conditions, providers that are aware of a hospital's QIP can  
15  
16 adjust their support accordingly. Participants agreed that QIPs should be the basis for discussions  
17  
18 with pharmaceutical companies about any given hospital's Key Performance Indicator's and  
19  
20 areas of focus. Frank, VP of patient services at a large community and teaching hospital (#5),  
21  
22 said: *"It's simple: just like a physician needs to know everything there is to know about a*  
23  
24 *patient's condition and health goals by looking into the patient's chart, a pharmaceutical*  
25  
26 *provider should know about a hospital in a similar way by looking at the QIP: the QIP gives*  
27  
28 *insights into the current status on the hospital in term of problem areas and direction it wants to*  
29  
30 *go in".* Mary (hospital #3) added: *"it is imperative for key suppliers such as pharmaceutical*  
31  
32 *companies to be aware of our Quality Improvement Plan so that they understand our priorities".*  
33  
34  
35  
36  
37  
38

39 It was implied by some participants that it is an advantage for any pharmaceutical company  
40  
41 to know as much as possible about a hospital's quality improvement metrics when dealing with  
42  
43 its decision makers, but it was also mentioned that this is rarely observed in real life. Bob  
44  
45 (hospital #1) commented: *"I don't typically expect a vendor to know about my goals, but when*  
46  
47 *they do, they automatically have insight into what is of importance to me. I don't meet many*  
48  
49 *representatives who actually take the time to investigate".* As it was explained understanding this  
50  
51 dynamic more thoroughly is essential in the hospital-pharmaceutical supplier interexchange. To  
52  
53 this end, the participants mentioned three key goal categories of a hospital QIP, which they said  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 that pharmaceutical companies should be aware of for relevant support provision. These are  
4  
5 goals relevant to *safety*, *effectiveness*, and *access*. While these goal categories appeared to relate  
6  
7 to all participating hospitals, the findings stressed the need to look into the content of each  
8  
9 hospital's goal to get a grasp on how a hospital would be best served.  
10  
11

12  
13 First, as it was explained, having *safety* goals is an enormous priority for a hospital. Patrick, a  
14  
15 VP of Patient services at a large teaching and research center (#3) associated with the largest  
16  
17 University in the province, stated that a safety agenda was their top priority: "*A safety agenda is*  
18  
19 *a proactive approach to avoiding risks. Our goal is to avoid and prevent any negative event on a*  
20  
21 *patient's health that could stem directly from being in the hospital environment. Also, having a*  
22  
23 *safety agenda includes ways to effectively and rapidly address issues when you have them*". The  
24  
25 findings illustrate the role that pharmaceutical companies can play in improving the safety of  
26  
27 care in a hospital by helping, for example, to control hospital-acquired infection rates. Bob  
28  
29 (hospital #1) provided the following thoughts: "*A pharmaceutical company can assist with the*  
30  
31 *provision of the needed education and knowledge so that hospitals use antibiotics*  
32  
33 *appropriately*". Paul (hospital #2), added: "*Patient safety is paramount and pharmaceutical*  
34  
35 *companies have the capacity and infrastructure to support us in this endeavor*".  
36  
37  
38  
39  
40

41  
42 Second, having an *effectiveness* goal was mentioned by participants as being equally  
43  
44 important. For example, senior management and pharmacy directors are responsible for  
45  
46 balancing the budget, and in doing so, must consider the impact of their choices (e.g.  
47  
48 pharmaceutical products) not only to the immediate budget they are responsible to manage, but  
49  
50 also to the hospital's Total Margin<sup>1</sup>. Brian (hospital #7) best describes his responsibility in  
51  
52 ensuring the hospital he works at is as effective as possible: "*Being able to provide quality care*  
53  
54

---

55  
56 <sup>1</sup>Total Margin is defined as follows: percent by which total corporate (consolidated) revenues exceed or fall short  
57  
58 of total corporate (consolidated) expenses, excluding the impact of facility amortization, in a given year.  
59  
60

1  
2  
3  
4 at a price point that is actually going to meet the funding formulas for the province [...] is my  
5  
6 challenge. We cannot skimp on medications which cause the patient to stay for an extra three  
7  
8 days, or go with a product just because it's cheap but causes all kinds of side effects and  
9  
10 complications: we are responsible for the broader view of effectiveness". Scott (hospital #6)  
11  
12 provides a thoughtful perspective about the pharmaceutical firm role in improving hospital  
13  
14 effectiveness: "To be able to deliver effective service, we must focus on developing our clinical  
15  
16 and distribution expertise, our educational skills, and we cannot do so without the needed  
17  
18 support by pharmaceutical companies"

19  
20  
21  
22 Third, the research suggests that hospitals, every year, have a focus on improving **access**;  
23  
24 with relevant actions set in line with each hospital's needs and circumstances. An example of an  
25  
26 access-specific goal that was mentioned was a hospital's need to improve wait times for patients  
27  
28 whether it is at the Emergency Room (ER) level, or surgery/Operating Room (OR) level. "Wait  
29  
30 times have improved over the past decade, with better triage and more stringent protocols which  
31  
32 provide clearer guidance to physicians, but we are far from being where we want to be. We can  
33  
34 always improve how we do things, especially with the aging population which should increase  
35  
36 flow through the ER over the coming decade", says Gareth, VP of patient services at a mid-size  
37  
38 community hospital (#9). The research participants stressed the role of pharmaceutical  
39  
40 companies in helping the hospital improve access. Bob (Hospital #1) mentioned:  
41  
42 "Pharmaceutical companies with their inventions can help support hospitals in treating patients  
43  
44 faster and more effectively than before and as a result becoming more accessible and able to  
45  
46 reduce patient wait times".  
47  
48  
49  
50  
51  
52

53 The findings suggest that value co-creation is deeply embedded in the interaction between  
54  
55 pharmaceutical company and hospital, where the first can improve customer value if tailoring its  
56  
57  
58  
59  
60

offerings and overall support to each hospital's QIP metrics. Such an approach may imply, at the same time, higher engagement from the customer to make sure that the provider becomes aware of a hospital's unique QIP priorities. Further, SAM can emerge as a value co-creation model when a pharmaceutical supplier is oriented towards supporting a hospital in improving quality through fulfilling specific safety, service effectiveness, and access goals.

#### 4.1.2 Tangible benefits specific to hospital context

The participants acknowledged having used help from sources external to the hospital to help them achieve their goals. However, the perceived value of external support varied greatly among participants, which may be due to differences in the context of the hospital, and will be analyzed in detail. Participants mentioned that the only time any kind of support is perceived as valuable is when there is a significant time or financial commitment on the pharmaceutical provider's part to a significant hospital issue. The major categories or types of value-added external support that hospitals mentioned receiving are: *subject-matter expertise*, *risk-sharing agreements*, *awareness/education campaigns*, *in-kind support* and *financial support*. However, it was articulated that support under each of these categories can be as diverse as the specific circumstances of each hospital client.

First, participants mentioned that a number of issues and/or opportunities may arise in a hospital setting which existing staff has neither the knowledge nor skill-set to leverage, and hence *subject-matter expertise* from outside the hospital may be required. An example of this was mentioned by James, CEO of a small hospital (#4), where their hospital used the services of a pharmaceutical company to allow completion of a complex special project: "*Last year, we enjoyed the support from a pharmaceutical company and a couple of external physicians in*

1  
2  
3 order to develop a treatment protocol for dealing with patients admitted with a Myocardial  
4  
5 *Infarction*. Without this external support, we could not have managed it". Patrick of hospital #3  
6  
7 mentioned an interesting use of a pharmaceutical supplier's capabilities to benefit their own  
8  
9 hospital: "A few years ago, in an attempt to improve our quality improvement culture, our  
10  
11 hospital used, free of charge, the services of one of our pharmaceutical suppliers. This company  
12  
13 significantly helped us address our issues, and in doing so, further solidified their relationship  
14  
15 with us". George (hospital #6) echoed: "A pharmaceutical company shared some of their  
16  
17 practices to help us in our endeavors to re-engineer our HR division. A small hospital like ours  
18  
19 can certainly benefit from the expertise of a large organization".  
20  
21  
22  
23

24  
25 A second type of support that participants mentioned having established with external  
26  
27 suppliers is *risk-sharing agreements*. The research suggests that in some instances, hospitals  
28  
29 have benefited from a vendor wanting to share some of the risks associated with the purchase of  
30  
31 a product or service with the purchasing hospital. Bob, pharmacy director with hospital #1  
32  
33 explained: "The hospital will agree to buy a product or service at market price from a company  
34  
35 under the condition that the so-called product or service delivers on its promise, for example, to  
36  
37 save other costs, to reduce wait times, or to get people back on their feet faster". Nik (hospital  
38  
39 #5) was more explicit: "Risk sharing is a must in a contract with a pharmaceuticals supplier,  
40  
41 especially in the case of new medicines or equipment that haven't largely used".  
42  
43  
44  
45

46  
47 The research shows that a third type of support to hospitals comes in the form of *awareness*  
48  
49 *and education campaigns*. There are a number of companies, as mentioned by participants, who  
50  
51 help develop and implement awareness or education campaigns. An example comes from a  
52  
53 pharmaceutical company that developed a campaign entitled "Just wash your hands" (Peter  
54  
55 hospital #1) to encourage patients entering the hospital to make use of the antiseptic soap readily  
56  
57  
58  
59  
60

1  
2  
3 available. Bob (hospital #1) elaborated: *“This initiative was perfectly aligned with the goal of*  
4 *reducing infection rates at our hospital, while also being an area in which the supplier had*  
5 *tremendous expertise, given that the partner was a pharmaceutical company that developed and*  
6 *marketed antibiotics for decades”*. Andrew (hospital #7) said: *“We certainly obtain value as a*  
7 *hospital from campaigns of pharmaceutical companies that offer information – for example on*  
8 *HIV or cancer. More informed patients are more collaborative”*. Such types of supporting  
9 educational initiatives were clearly flagged by interviewed participants as true value-added  
10 services that helped their hospital improve patient care. Participants mentioned that the  
11 consequence was increased trust by hospital management in these particular companies.  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23

24 *In-kind support* was mentioned by participants as another type of support that was, at times,  
25 provided by external suppliers. A few participants mentioned having received non-monetary  
26 support from their pharmaceutical suppliers in the form of “borrowed” infrastructure (e.g.  
27 meeting rooms) or administrative services. For example, James (hospital #4) said the following:  
28 *“We recently used a vendor’s state-of-the-art meeting facility that is about 60 minutes away from*  
29 *our hospital for one of our own hospital management team off-site meetings”*. Lucas (hospital #11)  
30 added: *“They (talking about a pharmaceutical supplier) maintain infrastructure which they*  
31 *always allow us to use when we undertake staff trainings. We want to see more of this from other*  
32 *suppliers as well”*. However, it was agreed that in-kind support such as this could not compare  
33 favorably to the value-add of an initiative that directly furthered patient outcome and enabled a  
34 hospital to meet some of their specific goals.  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49

50 *Financial support* to purchase new equipment, new technology, or simply to fund the  
51 expertise hired (and described above) was also mentioned as a valuable. Frank (#5) mentioned:  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 “Obviously, any time I get money to cover the cost of a specific initiative I have going, it helps  
4 me. Some companies are good with providing blank checks”.

5  
6  
7  
8 The findings illustrate that the value for a key pharmaceutical client such as a hospital is  
9 deeply rooted and developed in a customer-supplier relationship which allows the first to obtain  
10 benefits that are fully aligned to their own practice, goals, and needs. The section that follows  
11 focuses on the hospital-pharmaceutical company relationship, explaining the relational dynamics  
12 that are essential in allowing SAM to emerge and function as a value co-creation selling model in  
13 the pharmaceutical industry.  
14

#### 24 4.2 Relationship enhancers: Critical elements in a hospital-pharmaceutical company 25 relationship 26 27

28  
29 This section sheds light on a second concept, which appears to shed light on the dynamics  
30 allowing SAM to become and function as a value co-creation selling model in the  
31 pharmaceutical industry. This is the “relationship enhancers”, which refer to forces that can help  
32 strengthen hospital - pharmaceutical company relations and allow the first to enjoy value that is  
33 directed to their individual needs and demands. A number of “relationship enhancers” emerged  
34 from the research: a) *being centred on customer-need*; b) *striving for long-term partnerships*; c)  
35 *representing the entire company portfolio*; d) *measuring and sharing the impact of initiatives*;  
36 and e) *building relationships at all levels of the organization*.  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47

48 Further, the findings suggest that these “relationship enhancers” relate heavily with the  
49 “customer-tailored value-added initiatives” explained in the previous section; this relationship  
50 appears to be cyclical: ‘Relationship enhancers’ underpin and strengthen value added initiatives  
51 that are tailored to the needs of the customer (i.e. the more the relationship is enhanced, the more  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 the client perceives unique added value from pharmaceutical company initiatives); Relationship  
4  
5 enhancers' influence is magnified when pharmaceutical company initiatives are perceived as  
6  
7 value added (i.e. the more a pharmaceutical company pursues initiatives that are conceived as  
8  
9 value added by the customer, the more the 'relationship enhancers' can allow strengthening of  
10  
11 the client-supplier relationship).  
12  
13

14  
15 First, participants described the importance of a hospital-pharmaceutical company  
16  
17 relationship that is *centered on the needs of the customer* as a critical factor in driving customer-  
18  
19 perceived value, and hence in developing a solid hospital-pharmaceutical company relationship.  
20  
21 As it was explained earlier, the findings illustrate that hospitals as key customers (of  
22  
23 pharmaceutical companies) perceive an offering as valuable when it clearly meets their goals and  
24  
25 context. Helen (hospital #10) said: *"A b2b relationship to be successful needs to center on the  
26  
27 needs of the customer. This is what should prevail also in our interactions with pharmaceutical  
28  
29 suppliers"*. The findings suggest that the ability to adjust offerings and support on the  
30  
31 individualistic needs and context of the client stems from an ability to establish a relationship  
32  
33 with the client that values customer individuality and contextual boundedness. At the same time,  
34  
35 the findings illustrate that by being centered on the needs of a hospital, a pharmaceutical  
36  
37 company is more able to build a stronger relationship with the hospital (as a key client), which  
38  
39 can be fruitful and mutually beneficial over the long term. To this end, Bob mentioned: *"A large  
40  
41 check to support an initiative that has little value for my needs, and hence the patient, is in the  
42  
43 end money wasted. Instead, I prefer the company drops its product price point in order to enable  
44  
45 me to roll-out a truly value-added program with the money I saved. This can happen if a  
46  
47 pharmaceutical provider understands our exact needs and this is a passport for establishing a  
48  
49 truly long term mutually beneficial relationship"*. Martin echoed: *"Value added is when we  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60*

1  
2  
3 achieve a goal that is of high priority and flagged within our publically accessible QIP. Thus,  
4 any relationship that we build with a supplier of pharmaceutical products which can allow us  
5 achieving such goals, is definitely of the utmost value to us. Of course, it also helps strengthen  
6 our interactions further... ”.

7  
8  
9  
10  
11  
12 A second critical theme that emerged was how *striving for long-term partnerships* on the part  
13 of a pharmaceutical provider was integral in driving a deeper and more trustful customer-  
14 supplier relationship. The findings also suggest that long term partnerships are critical in driving  
15 initiatives that are value-added to the specific client but also in strengthening the customer-  
16 supplier relationship as a result of ongoing customer value creation. Alan (hospital #9) said:  
17 “Such a relationship should be established on long-term grounds”. Bob (#1) elaborated more on  
18 this issue, stating that partnerships are built over time and require a long-term approach in order  
19 to be successful. “Some pharmaceutical companies come to me and say: ‘We want to partner  
20 with you. What could we do in the next few weeks?’ That, to me, demonstrates that the supplier  
21 does not understand the world I live in, and the challenges I face. To succeed, relationships  
22 should become long term partnerships that will allow pharmaceutical companies to generate  
23 offerings and services that reflect our world. This is how a relationship can become valuable and  
24 this is how relationships can be sustained”. Another participant, Gary (#11), supported this  
25 thought: “Providing me with your services or money for you to benefit immediately with no  
26 consideration for my long-term goals is not going to get you very far”. John (#10) added the  
27 following: “Pharmaceutical companies should try to predict what the problems are going to be,  
28 two or three years out, in collaboration with the hospitals, instead of looking primarily at the  
29 next quarter’s revenue or profit”.

29  
30  
31  
32  
33

Third, participants expressed frustration from having to deal with multiple individuals from the same company. They stated a preference for dealing with individuals who *represent the entire portfolio of their company* (and not just a department, or Business Unit). Often, hospital senior managers mentioned they find it of value to establish a partnership with a vendor when one person can answer ALL their questions, and source the optimal solution from all product or service offerings from this company. Frank (#5) mentioned: *“The increased perceived-value stems from the belief that an agreement is more robust and beneficial if it covers a wider array of products and services – which often times will be the case for both parties”*. One example provided by Martin (#2) was how a representative from a pharmaceutical company managed to leverage discounted products from other Business Units within his company – an ultra-sound machine– to “sweeten” the deal on the purchase of specialty drugs. He mentioned: *“This was a ‘one-off’ offer that was never repeated but it brought a lot of value to our hospital, and this initiative went a long way for the representative who made this happen for us”*.

34

48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

Fourth, participants mentioned one additional factor that improves the relationship, and even at times may serve to establish the initial grounds on which to develop a relationship: participants expressed the need for the supplier to *measure the impact of the value-added initiatives developed*, and when possible, to share the results freely within the account and across with other hospitals. *“The only way to change the opinion of the pharmaceutical industry detractors, i.e. the people who have a negative opinion of the industry, is to demonstrate to them that your initiatives have actually bettered patient outcome”* very cleverly states Bob (#1). Gareth (#9) reinforced this thought with the following comment: *“If the initiatives you helped develop were actually successful, then by all means, you should be telling the whole world, and*

1  
2  
3 especially the customers who are skeptical and do not believe any good can come from a  
4  
5 hospital-vendor partnership.”  
6  
7

8 A final critical driver to the hospital-pharmaceutical company relationship was the  
9  
10 importance for the latter to *build relationships at all levels of the organization*. In other words, it  
11  
12 is important for the pharmaceutical provider to understand the individual responsibilities of all  
13  
14 departments within the hospital in the decision-making processes and to tailor their approach to  
15  
16 them. Although senior management participants in the research (CEO's and VP's) mentioned  
17  
18 that they are accountable for delivering against all goals, they also stated that the day-to-day  
19  
20 operations and the “how-to” are delegated to departments. One CEO (#4), James, mentioned:  
21  
22 “Of course, I want to know about any initiative that could impact our ability to reach our goals.  
23  
24 However, I am not interested in the details, at least not until the initiative is fully hashed out. You  
25  
26 are wasting time if you try to get me involved in the details”. Another CEO (#2), Martin, added:  
27  
28 “Similar to any business, I delegate responsibility, and partial accountability, of addressing  
29  
30 certain goals in our QIP to departmental heads. They are the ones driving all the activities. They  
31  
32 may consult with me at times, but they drive the boat”. Conversely, participants also mentioned  
33  
34 that for the partnership with the hospital to be long lasting and solid, a company needs to ensure  
35  
36 senior management is involved every step of the way, or at the very least, kept in the loop. “You  
37  
38 need to think holistically, because at the end of the day, it only takes one important decision  
39  
40 maker that is not on board or knowledgeable about your endeavors with our hospital to get in  
41  
42 the way of your objectives”, mentioned Frank (#5). Rico (#8) added: “I see myself as an  
43  
44 insurance policy for the SAM or the company that delivers value. It may be the pharmacy  
45  
46 director and departmental heads that drive formulary inclusion decisions for products in any  
47  
48 given therapeutic area, but I can intervene if I believe it is best for the hospital and the patients”.  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 The findings illustrate the need to consider a number of key elements that can contribute  
4 towards the enhancement of hospital-pharmaceutical company **relations**. It appears that a  
5 hospital-pharmaceutical company relationship can only address QIP considerations and tangible  
6 benefits to a hospital (i.e. value added that is tailored to the needs of the hospital) through the  
7 establishment of a close and long-lasting relationship between the two parties. At the same time,  
8 the hospital-pharmaceutical company relationship can be further enhanced through initiatives  
9 that are conceived as value added by the customer. The section that follows offers a conceptual  
10 model that depicts the study's emergent concepts and the relationships between them. It also  
11 discusses the findings in relation to existing literature.

## 27 **5. Discussion**

28  
29 The present study sheds light on the dynamics leading to value co-creation in the hospital-  
30 pharmaceutical company **relationship**, explaining how SAM can emerge and function as a value  
31 co-creation selling model in the pharmaceutical industry. The conceptual framework in figure 1  
32 reflects **the** study's findings and provides answers to **its** research question.  
33

37  
38  
39  
40

### 41 *5.1 SAM as a value co-creation model*

42  
43 Our findings offer fresh insight in the field of strategic account management, through a  
44 perspective of SAM model that relies on ongoing value co-creation between a customer and a  
45 supplier. Our research sheds light on Strategic Account Management as a client-centred selling  
46 model, which can lead to co-creation of value with the client, helping an organisation to delve  
47 beyond value creation embedded in predefined output (Gosselin and Heene, 2003; Gosselin and  
48 Bauwen, 2006; Vargo *et al.*, 2008). This conceptualisation of strategic account management, can  
49 help understand SAM as a system that shapes high-quality interactions between the organisation  
50  
51  
52  
53  
54  
55

60

1  
2  
3 and individual clients with the view to co-create products, services, and/or experiences that take  
4  
5 into account the client's peculiar circumstances (Prahalad and Ramaswamy, 2004). This way,  
6  
7 long term productive relationships with strategically important customers can be established  
8  
9 through efforts directed towards higher client engagement and co-ownership of the process  
10  
11 leading to value creation that is tailored to the needs of the client (Berghman *et al.*, 2006;  
12  
13 Cannon and Perreault, 1999; Gosselin and Bauwen, 2006; McDonald *et al.*, 1996; Storbacka,  
14  
15 2012).  
16  
17  
18

19  
20 Figure 1 illustrates the key value added and relationship-specific dimensions, which relate in  
21  
22 a cyclical manner to explain the dynamics that are essential for SAM to to function as a value co-  
23  
24 creation selling model in the pharmaceutical industry model. These dimensions are discussed in  
25  
26 detail below.  
27  
28

29  
30 *Insert Figure 1*

### 31 32 5.2 Value-added tailored to hospital needs

33  
34 The present research demonstrated that customers value initiatives that are tailored to their  
35  
36 specific needs and contexts. One critical dimension, which can allow customer tailored value  
37  
38 added involve pharmaceutical company-driven initiatives that can support a hospital in achieving  
39  
40 its organizational goals. To that end, the Quality Improvement Plan (QIP), which all hospitals are  
41  
42 obligated to develop and make publicly accessible through their websites, can be used as a good  
43  
44 identifier of the important goals of any given hospital. Consequently, the QIP content is  
45  
46 important and arguably a good starting point for any pharmaceutical company trying to uncover  
47  
48 how to bring unique value to a key client such as a hospital. The research findings suggest that  
49  
50 the key quality metrics that should be targeted by a pharmaceutical company to establish a  
51  
52 foundation of value-creating opportunities are *safety*, *effectiveness* and *access*. Moreover, once a  
53  
54 value-creating opportunity has been identified, the research suggests that considerable thought on  
55  
56  
57  
58  
59  
60

1  
2  
3 the part of the SAM needs to be put into how a value-creating initiative is developed and  
4  
5 implemented. The research suggests a number of types of initiatives to consider implementing  
6  
7 when trying to bring unique value to the hospital: *subject-matter expertise*, *risk-sharing*  
8  
9 *agreements*, *awareness/education campaigns*, *in-kind support* and *financial support*. The  
10  
11 findings illustrate that these pharmaceutical company-driven initiatives to be perceived as value  
12  
13 added by a hospital need to become specific to the needs and contexts of the latter. These  
14  
15 findings reflect a customer-supplier relational model that is driven by the need to adapt value to  
16  
17 the context of the client so that a customer's experience is maximized (Cannon and Perreault,  
18  
19 1999; Gosselin and Bauwen, 2006; Prahalad and Ramaswamy, 2004; Vargo and Lusch, 2008).  
20  
21 This is an approach that reflects the realities of a value co-creation system where client  
22  
23 individuality and idiosyncrasy are highly considered (Homburg *et al.*, 2002; Piercy, 2009;  
24  
25 Storbacka, 2012). The findings suggest that if a SAM system is driven by the need to  
26  
27 individualize value creation, then customers are more likely to perceive supplier initiatives as  
28  
29 beneficial.

35  
36  
37  
38

### 39 5.3 Relationship enhancers within SAM

40  
41 The literature reports that SAM fulfills the role of an enabler or promoter of an existing  
42  
43 relationship (Bacon, 1999), with the task to manage the relationship and optimize the fit between  
44  
45 the supplier's value offer and customer's needs (Weitz and Bradford, 1999). The present study  
46  
47 contributes to the literature on SAM by offering a context-specific understanding of the  
48  
49 relationship enhancers within SAM. The findings reflect the idiosyncrasies of the pharmaceutical  
50  
51 market where key accounts of pharmaceutical companies are hospitals (Wartenberg and Gores,  
52  
53 2008) and efforts should be directed in strengthening relationships with these organizations. Five  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 drivers surfaced from **the** research as important to managing hospital-specific relationships:  
4 *focusing on customer (i.e. hospital) needs, striving for long-term results and partnerships,*  
5  
6 *representing the entire company portfolio, measuring and sharing the results, and building*  
7  
8 *relationships at all levels of the organization.* **The present** work builds on previous studies on  
9  
10 SAM that illustrate the importance in focusing on the individual needs of each key customer  
11  
12 (Gosselin and Bauwen, 2006; Storbacka, 2012; Vargo and Lusch, 2008), in establishing long-  
13  
14 term partnerships with them (Vanderveer, 2001), and in matching seller and buyer relationship  
15  
16 requirements (Piercy and Lane, 2006).  
17  
18  
19  
20  
21

22 **The present** study **helps** also in unveiling new dimensions in SAM implementation and  
23  
24 functioning, which are not reflected in previous work. First, **the findings demonstrate** that a  
25  
26 supplier who wants to develop a partnership with a hospital must access the company's entire  
27  
28 portfolio of products and services in order to build a relationship with the most chances of long-  
29  
30 term continuation. Hospitals seek unique and innovative solutions that require out-of-the-box  
31  
32 thinking, and the supplier can more easily provide the answers if it can pull from a more vast  
33  
34 pool of resources. Second, **the findings suggest** for the supplier to conduct an analysis, where the  
35  
36 impact of the initiative developed in collaboration with the hospital is assessed in terms of  
37  
38 customer-perceived value, and weighted against all the resources utilized to elaborate the  
39  
40 initiative. Also, in cases where satisfactory results are observed, the research suggests that they  
41  
42 need to be shared with other customers in order to convince them of the potential value created  
43  
44 by developing partnerships with this particular supplier. To that end, **the present study** unveils  
45  
46 the potential benefits of having the results shared not only with society in general, but more  
47  
48 specifically with skeptical hospital customers that do not believe in the value that partnerships  
49  
50 with their suppliers could bring. A third driver not reflected in previous work suggests a  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 relational foundation on which to establish all interactions. Indeed, participants suggest that they  
4  
5 cannot all contribute value to the supplier in similar ways. This research suggests that different  
6  
7 objectives and expected outcomes exist when developing relationships with varying levels of  
8  
9 management within a hospital.  
10  
11

12  
13 The section that follows offers a summary of key findings and discusses the study's key  
14  
15 contributions, implications, and limitations.  
16  
17

## 18 19 20 **6. Conclusions**

21  
22 The present study sheds light on a number of dynamics that can explain the emergence and  
23  
24 functioning of SAM as a value co-creation system in the hospital-pharmaceutical relationship  
25  
26 (which is the dyadic relationship on which the authors of this article have focused to address  
27  
28 their research question). These dynamics are understood in the presence of two key dimensions:  
29  
30 'customer-tailored value-added initiatives' and 'relationship enhancers'. Customer-tailored  
31  
32 value-added initiatives explain the type of activities that are central to the hospital-  
33  
34 pharmaceutical company relationship and can enable the provision of value added that is unique  
35  
36 to the needs and context of the hospital. These initiatives involve activities that a) help hospitals  
37  
38 establish and communicate their annual quality improvement plan, and b) offer tangible benefits  
39  
40 that are specific to the realities and context of each hospital. The findings suggest that these  
41  
42 initiatives are driven by the relationship and allow the creation of unique value through the active  
43  
44 involvement of the customer (i.e. the hospital). Relationship enhancers explain the activities that  
45  
46 can help establish a hospital-pharmaceutical company relation that is underpinned by value co-  
47  
48 creation and the generation of value added that is unique to the client (i.e. the hospital).

55  
56  
57  
58  
59  
60

1  
2  
3       **This** research demonstrates a cyclical relationship between ‘customer-tailored value-added  
4 drivers’ and ‘relationship enhancers’: relationship enhancers enable the provision of products  
5 and services that are tailored to the needs and context of the individual customer (i.e. the  
6 hospital); when the hospital perceive enhanced value added from pharmaceutical company  
7 initiatives, ‘relationship enhancers’ influence is magnified to allow more sufficient and ongoing  
8 understanding of the customer context.

### 17 18 19 20 *Theoretical and Empirical Contributions*

21  
22       A key theoretical contribution of **this** work is the conceptualisation of ‘SAM as a value co-  
23 creation system’. This concept has emerged drawing upon an inductive reasoning, and explains  
24 the dynamics that should underpin customer and supplier (in this case a hospital and a  
25 pharmaceutical company) interactions to allow value to be created that is bounded in the context  
26 of the individual client. This theoretical framework brings together a number of research-  
27 emergent concepts to shed light on relevant dynamics and a cyclical relationship that can allow  
28 SAM to emerge and function as a value co-creation selling model.  
29  
30  
31  
32  
33  
34  
35  
36  
37

38  
39       **The present** study offers empirical contributions to the fields of strategic account management  
40 and pharmaceutical marketing. **It** contributes to the field of strategic account management  
41 through insight on SAM as value co-creating approach. Previous studies illustrate the importance  
42 of SAM as a value creation system (Gosselin and Bauwen, 2006). **The present article** extents this  
43 understanding by shedding light on the way SAM can allow a customer-supplier relationship to  
44 become more value added to the client through a system of value co-creation.  
45  
46  
47  
48  
49  
50  
51  
52

53       Further, the **present** work contributes to the field of pharmaceutical marketing by offering  
54 empirical insight on the conditions leading to a selling model that is perhaps more value-added  
55  
56  
57  
58  
59  
60

1  
2  
3 from the traditional systems in use. It introduces knowledge in an area that currently lacks  
4  
5 sufficient understanding on the applicability and use of SAM in the hospital-pharmaceutical  
6  
7 company dyad. **The present study** suggests a new approach to be considered in the context of  
8  
9 pharmaceutical marketing endeavors. Moreover, it sheds light on how value co-creation and the  
10  
11 way this can be seen to unfold in the pharmaceutical industry. This can be seen again as a key  
12  
13 contribution to the field of pharmaceutical marketing, which is primarily centered on product  
14  
15 driven perspectives (Wenzel *et al.*, 2014), and could shift into approaches that can allow better  
16  
17 appreciation of the needs and contexts of key clients.  
18  
19  
20  
21  
22  
23

#### 24 *Implications for practice and policy*

25  
26  
27 **The present** study has implications for industry practitioner (pharmaceutical industry  
28  
29 executives and sales people). Indeed, findings demonstrate that a number of conditions play in to  
30  
31 how value-added opportunities for customers should be identified, developed and implemented.  
32  
33 For example, the Quality Improvement Plan represents a significant source of potential  
34  
35 initiatives on which to elaborate a SAM strategy. Additionally, the framework proposes a holistic  
36  
37 approach to relationship management, which contributes to the practitioner's SAM  
38  
39 implementation plans. The proposed framework could, in fact, serve as a challenge for  
40  
41 pharmaceutical practitioners to experiment with a new model that can enable them to shift away  
42  
43 from existing selling practices which seem to be inflexible and non-sustainable. Experimentation  
44  
45 and further adaptation of the dynamics referred to in the proposed model may allow  
46  
47 pharmaceutical companies to radically change their marketing and selling perspectives and,  
48  
49 perhaps, become more client centered and informed as to how to contextualize their offerings to  
50  
51 each client's reality. Value co-creation via a SAM model could be the means through which  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 pharmaceutical companies can delve into a more client centric selling model and thus an  
4  
5 innovation that can lead to improved pharmaceutical marketing.  
6  
7

8 There are also implications for policy makers. Canadians not only pay high prices for drugs,  
9  
10 but heavily subsidize the development of new products (Petit, 2012). This issue has partly  
11  
12 contributed to the hostile environment in which pharmaceutical companies find themselves from  
13  
14 a public opinion perspective (Sillup and Porth, 2008). The study explores the QIP-centric (and  
15  
16 thus indirectly patient-centric) value-creation process that is possible through the implementation  
17  
18 of a SAM model, and thus provides government authorities arguments on the value, from a  
19  
20 societal perspective, of investing in pharmaceutical companies when wanting to justify public  
21  
22 investment in this industry's R&D. Moreover, the association of leading research-based  
23  
24 pharmaceutical companies in Canada, can consider using the SAM model's value-creating  
25  
26 potential to also heighten its reputation among Canadians. The results of this study suggest that a  
27  
28 shift in the selling business model from the old "frequency" approach to a SAM approach could  
29  
30 improve the perception that both the medical community and the public have of pharmaceutical  
31  
32 companies. Policy makers at the governmental and national industry association level could  
33  
34 benefit from investigating this upside further.  
35  
36  
37  
38  
39  
40  
41  
42

#### 43 *Future research*

44  
45  
46 **The present** work sheds light on dynamics allowing SAM to become a value co-creation  
47  
48 system in the context of the customer-supplier relationship. **More explorative research is**  
49  
50 **encouraged** to shed further light on the links between SAM and value co-creation. This way the  
51  
52 literature can become more informed on the value co-creation qualities of strategic account  
53  
54 management. Further, the theoretical model that **the authors of the present study** propose could  
55  
56  
57  
58  
59  
60

1  
2  
3 be further investigated quantitatively via a large-scale survey across industries to test whether it  
4  
5 applies to dyads aside the hospital-pharmaceutical company relationship and beyond the confines  
6  
7 of the pharmaceutical context.  
8  
9

10 An important theme that emerged from the present study was the role of Quality  
11  
12 Improvement Plans in value-added initiatives within the hospital-pharmaceutical company  
13  
14 relationship. Given that Quality Improvement Plans occupy a central role in hospital functioning,  
15  
16 the role of QIPs should be further investigated. Future qualitative or quantitative research could  
17  
18 explore the concept of “fit” between a hospital’s QIP metrics and the internal competencies of a  
19  
20 given supplier, as per Gosselin and Bauwen’s (2006) congruence principle. Quantitative work  
21  
22 could also focus on further elucidating the effectiveness of QIP individual quality dimensions on  
23  
24 SAM initiatives.  
25  
26  
27  
28  
29  
30  
31

### 32 *Limitations*

33  
34 Research limitations do exist within this study. First, the dynamics of the hospital  
35  
36 environment and politics within Canada are not necessarily reflected in other countries, and as  
37  
38 such the conclusions drawn from this research cannot be applied directly to another hospital  
39  
40 market without first investigating their similarities and differences. Second, the qualitative nature  
41  
42 of this study renders the findings preliminary and exploratory; they cannot be regarded as  
43  
44 conclusive and cannot be used to make generalizations to SAM models within the  
45  
46 pharmaceutical industry. Additional (large-sample) quantitative research is, therefore, needed to  
47  
48 test the generalizability of these findings to the pharmaceutical industry. In doing so, quantitative  
49  
50 studies should work first on the development of scales for measuring the key concepts of the  
51  
52 present study (a. the dimensions of ‘customer-tailored value added initiatives’ and ‘relationship  
53  
54  
55  
56  
57  
58  
59  
60

enhancers', and b. 'value co-creation' within the pharmaceutical company – hospital relationship) (see Figure 1 for the concepts). This can then enable a sound testing of the relationships between the two value co-creation dimensions, as well as their (individual and joint) impact on value co-creation within the pharmaceutical company – hospital dyad. Further, interviews were carried out only with customers in the dyadic, pharmaceutical company – hospital, relationship. Thus the study addresses the perceptions and understandings of the hospital on the co-creation perspective. This is a limitation in the sense that it gives a one-sided understanding of the phenomenon, which could be more spherically understood if data were collected from both actors (i.e. customers and suppliers) in the relationship. The phenomenon that the study was set to investigate, leads to another key limitation. Since the research focused on eliciting insight on what the participants would like to have in regards to value-added relationship, the data collected reflect just thoughts and expectations and not actual experiences. The lack of experience of the phenomenon would have biased the actual emergent insights, and thus the credibility of the findings and the emergent theory may be at risk. Finally, the fact that each case reflects the meanings and understandings of two research participants, this may not essentially convey the full phenomenon within each case study. A more saturated understanding would be secured if more people could be interviewed from each participating hospital. At the same time, interviews could also take place at levels beyond the senior management. This could lead to diverse insight that would shed more light on the phenomenon at hand.

**Table 2 – Profiles of Cases and research participants**

Case Number	Interviewee Pseudonym	Interviewee Title	Hospital type	Hospital context as described by participants
1	Bob	Pharm. Director	Large community, FM teaching center	Complex QIP with many different goals and challenges outlined, new surgery unit (cardiac, neuro), responsible for very high pool of patients/community (long wait times for most services), focused on driving innovation
	Peter	CEO		
2	Martin	CEO	Mid-size community	Straight-forward QIP with generic and standard goals
	Paul	Medical Director		
3	Patrick	VP – Patient Services	Teaching and research center	Complex QIP, with many goals and many internal stakeholders involved/mentioned, research focus, very large staff, highest EMR utilization in Ontario, associated with large University
	Mary	Pharm. Director		
4	James	CEO	Small community	Simple QIP with CEO close to all goals, low staff turnover in recent years
	Joseph	Medical Director		
5	Frank	VP – Patient Services	Large community, FM teaching center	Complex QIP, with particularly aggressive goals compared to other hospitals in terms of timeline and content. Recently became a teaching hospital
	Nik	Pharm. Director		
6	Scott	Pharm. Director	Small community	Hospital growing rapidly (doubled number of beds in recent years), QIP fairly extensive with goals primarily centered around managing the change
	George	CEO		
7	Brian	Pharm. Director	Mid-sized community	Extensive list of goals in QIP, large rehabilitation center (from fractures, stroke, M.I.)
	Andrew	VP – Patient Services		

1				
2				
3	<b>8</b>	Rico	CEO	
4				
5			Large	QIP online basic/generic, large private donations
6			community	every year → new infrastructure, with state-of-
7		Lisa	Medical	the-art facilities, openly standoffish from all
8			Director	industry
9	<b>9</b>	Gareth	VP –	
10			Patient	Extensive list of QIP goal, complex environment
11			services	as new teaching center, nearby hospital recently
12				closed creating a surplus of patients
13		Alan	CEO	
14				
15	<b>10</b>	John	CEO
