Qualitative Inquiry

Delving into the Unknown: An experience of doing research with d/Deaf prisoners

Journal:	<i>Qualitative Inquiry</i>
Manuscript ID	QI-18-235.R1
Manuscript Type:	Research Article
Date Submitted by the Author:	13-Sep-2018
Complete List of Authors:	Kelly, Laura; Harris Building, Lancashire Law School
Keywords:	prison, Qualitative Research < Methodologies, Interviewing < Methodologies, Deaf, communication
Abstract:	This article acts as a reflexive account of my experience of doing qualitative research with d/Deaf people in a prison setting. This research was the first in England and Wales (excluding small-scale unpublished undergraduate dissertations) to include semi-structured interviews with multiple d/Deaf prisoners, and thus the journey documented is both innovative and unique. Because I was entering unmarked territory methodologically, my experience was laden with obstacles, as is discussed throughout. Key issues explored relate firstly to the process of gaining access to d/Deaf prisoners, secondly to researcher-participant language barriers, and thirdly to issues of ethics and authenticity generated by the Deaf participants' preference for a visual language (British Sign Language) in a setting like prison. Guidance is given throughout about how to overcome complex methodological issues, and concluding remarks include a set of recommendations for prospective researchers.

Delving into the Unknown: An experience of doing research with d/Deaf prisoners

Dr Laura Kelly.
Lecturer in Criminology, University of Central Lancashire
Highest degree: PhD
Address: Harris Building, University of Central Lancashire, Preston, PR1 2HE
Email: LKelly13@uclan.ac.uk

Biographical statement

Laura is a lecturer in Criminology at the University of Central Lancashire who specialises in prison studies. She was awarded her PhD for the thesis entitled 'Silent Punishment: The experiences of d/Deaf prisoners' in July 2017, and won the Prison Service Journal outstanding article of the year 2017 based on an article that outlines findings from this. Laura facilitates an annual student/prisoner debating programme at HMP Kirkham called 'Debating Differences'.

Abstract

This article acts as a reflexive account of my experience of doing qualitative research with d/Deaf people in a prison setting. This research was the first in England and Wales (excluding small-scale unpublished undergraduate dissertations) to include semi-structured interviews with multiple d/Deaf prisoners, and thus the journey documented is both innovative and unique. Because I was entering unmarked territory methodologically, my experience was laden with obstacles, as is discussed throughout. Key issues explored relate firstly to the process of gaining access to d/Deaf prisoners, secondly to researcher-participant language barriers, and thirdly to issues of ethics and authenticity generated by the Deaf participants' preference for a visual language (British Sign Language) in a setting like prison. Guidance is given throughout about how to overcome complex methodological issues, and concluding remarks include a set of recommendations for prospective researchers.

5 The fact that prison as an institution is designed to punish and constrain (Crewe, 2011) and is largely hidden
6 from the public eye, means that it presents somewhat of an enigma to the majority of those who have not
7 been confined within its walls (Sparks, Bottoms & Hay, 1996). In order to unravel some of the mystery
8 surrounding the realities of prison life, in recent decades there has been a surge in prison research and with
9 this has come an assortment of accounts from researchers about the pathways taken through their research.
10 The form that these accounts take varies significantly. While some researchers simply provide an outline of the
11 research design utilised, others endeavour to provide detailed reflexive accounts of their research journeys,
12 considering factors such as the issues that they faced (King and Liebling, 2008; Stevens, 2013; Sloan & Wright,
13 2015), their subjective role in the research process (Liebling, 1999; Phillips, 2012; Hammersley, 2015) and the
14 impact that they had on the findings (Drake, 2012; Rowe, 2014). These in-depth accounts can be of particular
15 use to prospective prison researchers, affording them an insight into the realities of doing prison research, and
16 some of the “methodological landmines” (Schlosser, 2008: pp. 1501) that the prison environment generates.

26
27
28
29 This article acts as a reflexive account of my journey through my doctoral research which examined the
30 experiences of hard of hearing (HoH) and d/Deaf prisoners in England and Wales. An exploratory qualitative
31 research design was utilised throughout, and semi-structured interviews with prisoners and staff members
32 were the main form of data collection. In many ways my experiences were similar to those of other
33 researchers; moulded unavoidably around the unique nature of the prison environment, and the challenges it
34 presents. However, the fact that my focus was on d/Deaf prisoners created a myriad of additional
35 methodological complications, as unlike many other minority groups in prison in England and Wales, those
36 who are d/Deaf have rarely been considered empirically.

37
38
39
40
41
42
43
44
45 Prior to this study, the most comprehensive research carried out in this area was by McCulloch (2010, 2012)
46 who as part of his MA, looked at the experiences of this group and considered whether their rights were
47 upheld in prison. Due to access issues and time constraints, McCulloch collected his data by writing letters to
48 participants rather than carrying out interviews, which he acknowledges could have impeded the richness of
49 the data. This meant that at the time of this study, there was little information available about how to go
50 about carrying out research of this type, and as such the path that lay before me was largely unmarked.

1
2
3 Because of this, the research process became laden with unexpected obstacles, including issues relating to
4 gaining access to d/Deaf prisoners, problems associated with researcher-participant language barriers, and
5 added complexities in the process of recording and transcribing interviews where the participant
6
7 communicated in British Sign Language (BSL). While issues relating to communication have been experienced
8
9 by individuals carrying out research with d/Deaf people in other social settings (Young & Hunt, 2011;
10
11 Sutherland & Young, 2014; Wilson & Winiarczyk, 2014), throughout this article it is shown that the secure and
12
13 restricted nature of the prison environment often exacerbates such issues, and also generates further
14
15 methodological complications. It is important to acknowledge that my status as a hearing person with limited
16
17 comprehension of BSL also enhanced communication related difficulties, as is discussed throughout.
18
19

20
21 The first section of this article lays out the aims of the research and the research method used in more detail.
22
23 After this, my journey through the fieldwork process is documented, with key themes being access, data
24
25 collection, recording and transcription, ethical considerations, and the management of inevitable subjectivity.
26
27 While links are made to the methods and experiences of other prison researchers where relevant, I also
28
29 discuss the extra complications I encountered throughout and the ways I attempted to navigate and overcome
30
31 them. This is important as it will provide an indication for other researchers about what to expect if they are
32
33 intending to carry out qualitative research with d/Deaf people in a prison setting.
34

35 **The Research: Aims and Method**

36
37 The primary aim of this research was to provide a more rigorous and comprehensive account of the lives of
38
39 d/Deaf prisoners in England and Wales than was already available. In order to address this aim, meaningful
40
41 consideration was given to the role of 'imported' identity, and the complex layers of d/Deafness¹. As such, the
42
43 experiences of medically *deaf* and culturally and linguistically *Deaf* prisoners were examined separately². This
44
45

46
47 ¹ This is a key weakness of McCulloch's study. While he does provide the most comprehensive account of the problems
48
49 faced by d/Deaf prisoners in the UK, he fails to differentiate meaningfully between the experiences of prisoners who are
50
51 deaf, and those who are culturally and linguistically Deaf.

52
53 ² For the purposes of clarity, the two terms must be defined. Medical deafness is a clinical condition, which sits on a
54
55 spectrum according to the quietest sound that an individual is able to hear. The extent to which a person is medically deaf
56
57 varies significantly from those whose hearing is only slightly impaired, to individuals who are hard of hearing (HoH), and
58
59 finally to those who are severely deaf (Action on Hearing Loss, N.D). In contrast to this, cultural definitions of d/Deafness
60
focus on identity, and the way in which an individual identifies with their d/Deafness. Thus, individuals who are culturally
and linguistically Deaf identify as being part of a culturally distinct minority group, who commonly use British Sign
Language (BSL) to communicate (Padden, 1980). These individuals are seen as being part of the Deaf Community, which is
comprised of people who are proud to be Deaf and share the same language, similar cultural values and common life
experiences (Leigh, 2009). This contrasts significantly with those who are medically deaf (but not culturally Deaf) who
usually view their deafness as a problem, and commonly feel stigmatised by it (Higgins, 1980).

1
2
3 distinction between medical deafness and cultural and linguistic Deafness was pivotal to the research, and
4 contributed to many of the methodological complications I experienced. These complications stemmed from
5 the fact that individuals who are Deaf usually communicate and behave in largely visual ways.
6
7

8
9 In a similar vein to other prison studies (Jewkes, 2002; Scott, 2006; Phillips, 2012), the research took a
10 qualitative line of enquiry. The primary method of data collection was semi-structured interviews, which took
11 place at seven adult male prisons in England. 27 interviews were carried out on an individual basis; 17 with
12 HoH/d/Deaf prisoners and 10 with staff members who had worked with them. Of the prisoners interviewed,
13 seven were culturally and linguistically Deaf, five severely deaf and five HoH. A group interview was also
14 carried out which involved four culturally and linguistically Deaf participants, each of whom had been
15 interviewed individually as well. All interviews were recorded using a Dictaphone, and in instances where a
16 participant's first language was BSL, a qualified interpreter was present³.
17
18
19
20
21
22
23
24

25 Observation was used as a secondary research method, and as such, throughout the fieldwork process
26 observations were made at all of the establishments entered. These observations were then recorded in a
27 journal, where a detailed account of my time at each prison was provided, including details about sights,
28 sounds, interactions and relationships. Using observation to supplement interviews enhanced the quality of
29 the research in that it helped me to gain a richer understanding about prison life (for similar findings, see also
30 Scott, 2006; Crewe, 2009), and the position of d/Deaf prisoners within it.
31
32
33
34
35
36

37 An explorative qualitative approach was deemed most appropriate given the fact that so little empirical
38 research had been carried out with this particular group in prison (Mason, 2002). The use of semi-structured
39 interviews proved effective as it enabled a certain level of consistency to be maintained within the findings
40 (Scott, 2006), whilst also allowing for a series of open-ended questions to be asked. This afforded participants
41 the opportunity to express their opinions in their own way, in a conversational format. The lack of strict
42 structure gave me the flexibility to probe more into certain responses, which was useful in terms of both
43 clarification and elaboration (Liebling, 1999; May, 2001). Room to clarify was particularly important during
44 interviews with culturally and linguistically Deaf participants, who often misinterpreted the question that was
45 being asked via the interpreter. Consequently, they would often provide confusing responses which required
46
47
48
49
50
51
52
53
54

55
56 ³ The interviews were preceded by a pilot staff member interview and a pilot prisoner interview, where I tested out my
57 interview schedules. The pilot interview with the prisoner is discussed further later in the article.
58
59
60

1
2
3 further probing from me and re-interpreting from the interpreter (for similar findings see Murray & Wynne,
4 2001; Young & Hunt, 2011).

5
6
7 When the fieldwork began I had not planned to carry out any group interviews. However, during my time at
8 HMP Bowdon⁴ where I interviewed five culturally Deaf prisoners, it became clear that a number of participants
9 were under the impression that they were going to be interviewed as a group. These individuals were eager to
10 participate in a joint discussion, and thus, a group interview was organised on the spur of the moment, taking
11 place later the same day with four of the participants. This proved invaluable in terms of the richness of the
12 data collected, as it transpired that the participants were much more comfortable discussing their experience
13 at the prison while they were with other Deaf people, and often reminded each other of things that had not
14 been mentioned within individual interviews (see also Matthews & Ross, 2010; Bryman, 2012).

23 **The Impossibilities of Accessing an Unknown Population**

24
25
26 After outlining the chosen methods of data collection, consideration is now given to the process of negotiating
27 access to the participants. 'Getting in' to prison creates issues for most prison researchers to some extent (see
28 for example, Stevens, 2013; Sloan & Wright, 2015; Wincup, 2017), and like many before me, gaining access to
29 the research sample was perhaps the most complex "methodological landmine" (Schlosser, 2008, pp. 1501)
30 that I faced. Although I did have some prior experience of carrying out prison research and had engaged with
31 relevant literature, in reality the intricacy of the process transcended my expectations. Such intricacies were
32 compounded by issues relating to my chosen sample, as to be discussed below.

33
34
35 In order to gain access to the research sample I was required to go through a centralised National Offender
36 Management Service (NOMS)⁵ application process. This began with the submission of an application form⁶
37 along with a copy of my CV, ethical clearance from the University of Central Lancashire (UCLan)⁷ and drafted
38 consent forms and information sheets to the National Research Committee (NRC)⁸. Certain aspects of the

⁴ All prison names in this article are pseudonyms.

⁵ Now called Her Majesty's Probation and Prison Service (HMPPS).

⁶ Within the application form I was required to supply information about the aims of the project, the benefits that it would have for the Prison Service, whether it would add to existing literature, its methodology and any ethical issues (amongst other things).

⁷ Inclusion of ethical approval was problematic as the UCLan were unwilling to provide ethical approval until I could show evidence of approval from NOMs. In order to overcome this issue, I applied for ethical approval in principle which UCLan agreed to grant. Once NOMs clearance had been given, I then re-applied to the ethics committee for full approval.

⁸ The NRC was a subsection of NOMs that assessed research applications based upon a number of criteria, including the

1
2
3 application form were difficult simply because I was not able to provide the information that was being
4 requested. This related primarily to questions about the proposed methodology of the research, as within this
5 there was a requirement to discuss the size of the research sample, and to provide a list of the establishments
6 that I would be entering. This was particularly challenging given that there is currently no legal requirement for
7 the Prison Service to keep records of numbers and/or locations of d/Deaf prisoners (Kelly, 2017). Without this
8 information I was unable to specify with any certainty how many people I wanted to interview, or where such
9 interviews would take place.

10
11 This obstacle could have been overcome by contacting prisons individually and requesting the information.
12 However, when I attempted to make contact, establishments were usually unwilling to respond in any
13 meaningful way because I did not have official approval. As an alternative I used information provided from
14 other sources⁹ to collate a list of establishments within which I had been advised one or more d/Deaf prisoners
15 had resided in the preceding year. I also provided a predicted sample size of a minimum of eight d/Deaf
16 prisoners and stated that I would be interviewing staff members but that I was unable to provide specific
17 sample numbers. Aware of the vagueness of this estimation, I also specified that once clearance had been
18 gained, letters would be sent to the governor of every prison establishment in England and Wales to confirm
19 whether there were any d/Deaf prisoners there.

20
21 The application was initially approved 'Subject to Modifications', with the primary condition of the approval
22 being the clarification of sample sizes. In order to gain such clarity, a letter requesting information about
23 d/Deaf prisoner numbers was sent to the governor of every establishment in England and Wales. Although the
24 letter contained proof of the approval with modifications, when I began to receive responses it became clear
25 that many prisons were unwilling to provide any information without full approval. This created a frustrating
26 tautological cycle, in that I could not obtain full approval without a clearer conception of sample sizes, and the
27 only way I could get such information was from the prisons themselves.

28
29 Further hurdles then arose when NOMS contacted me stating that they had received correspondence from
30 institutions that were not included in my proposed prison list. I was advised that if I wanted to contact other
31

56 the research will have upon prison resources.

57
58
59
60
⁹ These included individual prison staff members, charities, and other researchers.

1
2
3 prisons I would need to amend my application and include them in my proposed sample. I was also urged to
4 stop sending letters, and to contact prisons via NOMS from that point on, even though my application had
5 stated that letter writing would be the primary way of locating potential participants. As an alternative method
6 of sample location, I was given access to data from the National Offender Management Information System
7 (NOMIS) which is described as the “Operational database used in prisons for the management of offenders”
8 (Ministry of Justice, N.D). This was relevant to the research as although there is no legal obligation to record
9 numbers of d/Deaf prisoners, NOMS advised that NOMIS was being used by some prisons to record figures of
10 prisoners who had self-declared as having disabilities (amongst other things). However, the only relevant
11 category in this context was “Hearing Difficulties” which meant that I had no way of distinguishing between
12 those who were culturally and linguistically Deaf, those who medically deaf, those who were HoH and those
13 who had a minor hearing problem.
14
15
16
17
18
19
20
21
22
23

24 Despite being told to use NOMIS from then on, because the letters had already been sent out I continued to
25 receive responses. Although a significant percentage of establishments were unwilling to provide information
26 until full approval had been gained, others provided the information much more readily. Subsequently, five
27 months after initially submitting the application I had collected enough information about the whereabouts of
28 d/Deaf prisoners to be able to contact NOMS with a list of prisons that I would potentially be entering. At this
29 point, full approval was awarded, and although this did not guarantee access to these prisons¹⁰, it gave me the
30 opportunity to focus my attention on a much smaller number of potential fieldwork locations. From this, over
31 a period of numerous months I liaised with each of the prisons either via letter, email or telephone on an
32 ongoing basis in a bid to negotiate access.
33
34
35
36
37
38
39
40
41

42 While the experiences of existing prison researchers (Liebling, 1999; Martin, 2000; Jewkes, 2002; King &
43 Liebling, 2008) did enable me to foresee there being delays in the provision of access, I had not considered
44 how lengthy the negotiation and organisation process would be. Some establishments responded to
45 correspondence promptly, however, in most instances, this was not the case. The general trend was that I
46 would receive an email/letter, respond immediately and then wait weeks or even months to receive a
47 response. As with the findings of Crawley (2004), staff members provided reasons such as illness, shift patterns
48 and being understaffed to explain such delays, with access never actually being negotiated at one particular
49
50
51
52
53
54
55

56 ¹⁰ Access to an establishment is at the discretion of individual governors.
57
58
59
60

1
2
3 prison because the allocated contact went on long-term sick, only to be replaced by a substitute contact who
4 then also went on long-term sick. Another reason for delayed correspondence was attributed to public sector
5 budget cuts, and, mirroring the experiences of King and McDermott (1995) and Genders and Player (1995)
6 whose research was affected by wider organisational changes, numerous allocated contacts advised that as a
7 result of nationwide organisational benchmarking they were so understaffed that they did not have time to
8 respond or had been seconded to other roles.
9

10
11
12
13
14
15 Furthermore, the chaotic and unpredictable nature of the prison environment meant that access related issues
16 continued to arise even after establishments had confirmed their willingness to be involved in the research,
17 and had specified the presence of an appropriate participant. Like Davies (2011) I found that prior
18 commitments on behalf of staff members often made it difficult to organise a specific date for interviews to
19 take place. Although I knew that I needed to be flexible and willing to adapt to the daily workings and
20 institutional timetable of each prison (Martin, 2000; Wincup 2017), such flexibility was often not an option.
21
22
23
24
25
26 The reason for this centred around the necessity for a BSL interpreter in instances where I would be
27 interviewing a Deaf prisoner, as although I was able to be sufficiently flexible, my interpreter¹¹ who had other
28 commitments, was not. On some occasions this meant that I had little choice but to decline suggested
29 interview dates with the hope that they could be rescheduled. However, in one instance my interpreter was
30 not able to commit to attending the interview, and the prison was not able to reschedule. Therefore, in order
31 to avoid missing out on the opportunity to interview a culturally and linguistically Deaf prisoner I used the
32 services of a different qualified BSL interpreter, as to be discussed later in the article.
33
34
35
36
37
38
39

40
41 Even at the point where an interview time and date had been arranged, further complexities in the access
42 process continued to arise. Originally I had been interested primarily in the experiences of culturally and
43 linguistically Deaf prisoners (and medically deaf prisoners to a lesser extent), and had made this clear in all
44 correspondence with prisons. However, this intended utilisation of a purposive sampling frame was
45
46
47
48 undermined by the fact that my allocated contacts often had little conception of the multiple layers of
49

50
51 ¹¹ My interpreter was one of my PhD supervisors, who was a qualified BSL interpreter and had agreed to interpret for me in
52 order to avoid excessive research costs. Other members of my supervisory team were concerned that this may be
53 perceived by some as a conflict of interest, and thus, in order to address this concern, advice was sought from the
54 university. This issue was initially raised with the head of the UCLan's ethics committee and then the university's research
55 committee who advised that "The supervisory team interpret many aspects of a student's research – What he is doing is
56 practical, necessary and he knows how. Unless he misinterprets the answers deliberately and mis-signs the questions – I
57 see no issue". It was then advised that the University would also take this stance in the future.
58
59
60

1
2
3 d/Deafness, and thus were ill-equipped to distinguish between those who were medically deaf and those who
4 were culturally and linguistically Deaf. This was compounded by the ambiguity of the data available on NOMIS,
5 which many of my contacts were relying on. Without a formal distinction between Deafness and deafness in
6 the NOMIS data, many contacts then labelled prospective participants based upon their own understanding of
7 d/Deafness which was often limited. For example, prior to my pilot prisoner interview I had been advised that
8 the participant was culturally and linguistically Deaf and that a BSL interpreter would be required. However,
9 upon arrival it became apparent that he was in fact partially deaf and had residual hearing in one ear. He was
10 unable to communicate in BSL and relied upon a hearing aid and the ability to lip read when conversing, which
11 meant that my interpreter had attended unnecessarily and that many of the questions in my pilot interview
12 schedule were not relevant. This pattern continued throughout the research process, meaning that I had to
13 prepare for multiple eventualities prior to each interview. It also altered the make-up of my sample, extending
14 it to include more medically deaf participants than envisaged and a number of HoH participants. Despite initial
15 doubts, this proved advantageous as it allowed for in-depth consideration to be given to the role of imported
16 identity, which, as already mentioned, then went on to become pivotal to the research.

22
23
24
25
26
27
28
29

30 **The Intricacies of Interviewing**

31
32
33 Throughout the interviews, similar themes usually arose due to the nature of the questioning. However,
34 interviews were affected by a number of key factors, including the extent to which an individual was d/Deaf,
35 institutional involvement, the participant's method of communication, their role in the prison, and the way
36 they perceived me, the researcher. Each of these factors will now be discussed in turn.
37
38
39
40

41 The impact of identification

42
43
44 The level to which an individual was d/Deaf had a significant impact on their openness during interviews. Most
45 of the d/Deaf prisoners interviewed were open and engaged during their interviews, appearing to relish the
46 opportunity to discuss their lives, perceptions and problems with an interested outsider (for similar findings
47 see also Bosworth, Cambell, Demby, Ferranti & Santos, 2005; Stevens, 2013). This was particularly true for
48 those who were culturally and linguistically Deaf, as these individuals are commonly deprived of meaningful
49 communication in prison (Kelly, 2017). Because of this they appeared to perceive their interview as an
50
51
52
53
54
55
56
57
58
59
60

1
2
3 opportunity to get their point of view across to somebody who understood them, and on some occasions, just
4
5 to communicate generally. This is highlighted below in an interview abstract:

6
7 P1W: It's a real problem for me inside. I keep it in. We are communicating now at
8
9 this appointment, and I was EXCITED to come here. I was excited to see you
10
11 because I knew I would be communicating with people. But out there I have to
12
13 hold it all in, and I really do struggle.

14
15 Interviewer: So is it nice to have somebody that you can sign with then?

16
17 P1W: Yeah. It is.

18
19 Interviewer: Okay. Just a couple of questions, I know I've kept you for ages so
20
21 thank you.

22
23 P1W: *Starts crying*

24
25 Staff: I'll go and get a tissue.

26
27 Interviewer: Oh no, are you okay? Are you alright?

28
29 P1W: Yeah, I just get upset because I need to communicate.

30
31
32 The HoH participants were much less willing to engage fully during interviews, and were at times curt and
33
34 dismissive when asked about their hearing loss. Central to this was the fact that they often felt stigmatised by
35
36 it, and were embarrassed (despite having agreed to be interviewed) (Kelly, 2018). While this was awkward at
37
38 the time, it proved beneficial as their responses highlighted clearly how negatively they felt about their hearing
39
40 loss, which then allowed me to explore with them how these feelings impacted on their lives in prison.

41 42 Institutional Influence

43
44
45 The secure, highly regulated and restrictive nature of the prison environment meant that all interviews were
46
47 affected by the institution to some extent. The institutional timetable often dictated the duration of an
48
49 interview, with a number of interviews being cut short because of other priorities (Martin, 2000; Wincup &
50
51 Hucklesby, 2007; Wincup, 2017). Also, the fact that prisoners have to be in their cells at certain points, and can
52
53 only move around the prison at very specific times created difficulties, particularly at HMP Bowdon where I
54
55 was interviewing four Deaf prisoners in a row. Staff at the establishment had created an interview timetable
56
57
58
59
60

1
2
3 which allocated participants specific interview slots in order to ensure they were all back in their cells at the
4 right time. This was troublesome as the slots were much too short; meaning that a number of interviews were
5 brought to an end abruptly because they had exceeded their allocated time allowance. The fact that this was
6 during interviews with Deaf participants created particular difficulties given that these interactions take longer
7 anyway because all communication has to be mediated by a BSL interpreter (Almalik, Kiger & Tucker, 2010;
8 Ingvarsdotter, Johnsdotter & Ostman, 2010)¹².
9
10
11
12
13

14 While all of the staff member interviews took place in a private location, all but three of the prisoner
15 interviews were conducted in the presence of a prison official. Like others, I found that this lack of privacy
16 often affected the interview (Scott, 1996; Hucklesby & Wincup, 2007); potentially inhibiting disclosure, and at
17 times directly affecting the topics discussed. In terms of the latter point, there were instances where present
18 staff members became involved in the dialogue between me and the participant. This was particularly
19 prominent during one interview where the staff member repeatedly interrupted the participant when he was
20 critical of his treatment at the prison in order to provide an explanation for such treatment. Another example
21 occurred when a present staff member attempted to steer the discussion on occasions where he thought that
22 the nature of the prisoner's comments was not appropriate/relevant. He would do this by interjecting with
23 remarks such as "Should we get back to the deafness?" when the participant was discussing his experience of
24 prison more generally, which then caused him to apologise and change the subject. This intrusion was
25 detrimental to the quality of the data, as in these instances the prisoner was talking candidly and providing
26 rich insight into some of the realities of prison life.

41 Communication

42
43 The method of communication used in each interview had a significant impact on the interview format and the
44 extent to which I was able to build rapport with participants. The fact that the interviews were carried out with
45 participants across the hearing-Deaf spectrum meant that methods of communication varied from interview to
46 interview. Communication during the interviews with staff members, deaf/HoH prisoners who had adequate
47 hearing aids and prisoners who were only mildly HoH was straight-forward because they all communicated
48 verbally, and could hear enough to interact with relative ease. However, in instances where individuals were
49
50
51
52
53
54

55 ¹² This could have impeded the quality of the data collected. However, the fact that these interviews were followed by a
56 group interview combatted this, as it gave participants the opportunity to discuss their points in more depth.
57
58
59
60

1
2
3 more severely HoH/deaf and did not have access to adequate hearing aids, communication became much
4 more difficult. Although the method of communication itself was the same for all of these prisoners i.e. they all
5 communicated verbally, our interactions were more disjointed because they could not hear sufficiently. This
6 made it more difficult to build rapport as I often had to continuously repeat myself to individuals who would
7 mishear questions and provide unrelated answers (see also Young & Hunt, 2011). For example, one participant
8 was severely deaf in both ears but had no access to hearing aids and had not learnt to lip read since going
9 deaf. As a result of this I struggled to interview this participant and felt awkward throughout the duration of
10 our interaction.
11
12
13
14
15
16
17

18 My inability to utilise BSL beyond a very basic level had a significant impact on the interviews with the
19 culturally and linguistically Deaf participants, all of whom preferred to communicate in this way. Because of
20 this language barrier, I found it extremely difficult to build rapport with a number of the Deaf interviewees
21 (see also Murray & Wynne, 2001; Almalik et al., 2010; Ingvarsdotter et al., 2010; Young & Hunt, 2011), as
22 shown here in an extract from my fieldwork journal:
23
24
25
26
27

28
29 It is very hard to conduct any interview with someone who doesn't speak your
30 language, never mind when you are trying to ask somebody about their personal
31 experiences and private emotions; You lose all the non-verbal cues and
32 interactions and this makes the flow of the interview less conversational and more
33 question answer question answer question answer (19th February 2015).
34
35
36
37
38

39 Furthermore, even though participants had been made aware that an interpreter was present in order to
40 bridge the communication barriers between interviewer and interviewee and would not be actively involved in
41 the dialogue between the two, they often misinterpreted this. Rather, because it was the interpreter who was
42 providing them with the information that they could understand, participants often appeared to think that the
43 information was actually coming from them. Because of this, on multiple occasions participants attempted to
44 communicate with the interpreter. For example, during one interview the participant focused his responses at
45 the interpreter rather than myself and at one point asked him whether he ever went to Deaf clubs. This was
46 highlighted further during another interview where I had similar problems, as shown in another extract from
47 my fieldwork notes:
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 If anything I felt like the prisoner was warming to the interpreter because it was
4 they who they could communicate with, rather than me even though they were
5 my words. As a result of this I felt almost like a third wheel in my own interview
6
7
8 (7th May, 2015).
9

10
11 Situations such as this were frustrating as although I attempted to build a rapport with these participants,
12 without a common language this was very difficult.
13
14
15

16 The role of the researcher

17
18 Before beginning the fieldwork, I was aware that the level to which a participant engages in research is
19 contingent upon the identity they give to the researcher and what they perceive their intentions to be (Morris
20 & Morris, 1963; Emery, 1970; Sparks et al., 1996; Stevens, 2013; Drake & Harvey, 2014; Rowe, 2014). With this
21 in mind my main concern was how my status as a hearing person might impact upon the way the culturally
22 Deaf participants would respond to me. This concern was based on advice from my supervisory team and
23 information drawn from existing literature, both of which suggested that their prior experience with hearing
24 people may cause the Deaf participants to be suspicious of me, and unwilling to engage (Atherton, Russell &
25 Turner, 2001; Harris, 2010; Young & Hunt, 2011; Stone & Mason, 2012). Fortunately, none of the Deaf
26 participants involved in the research were outwardly resentful or uncooperative. Rather, it appeared that any
27 preference for a Deaf interviewer was outweighed by a desire to get their story across to anyone who would
28 listen, irrespective of their status.
29
30
31
32
33
34
35
36
37
38
39

40 I was also aware that participants often misinterpret the identity of researchers, and presume them to be
41 something that they are not (Morris & Morris, 1963; Emery, 1970; Sparks et al., 1996; Crewe, 2009; Phillips,
42 2012; Stevens, 2013; Scraton & Moore, 2013; Scott, 2015a). Therefore, in order to minimise any ambiguity
43 about my identity I made it clear within information sheets and consent forms, and at the beginning of each
44 interview that I was from a University and was carrying out an independent study without any underlying
45 agenda. As part of this, I specified that I was aiming to contribute to some positive change for d/Deaf people in
46 prison. While I had assumed that this would help to ensure clarity about my motive, it became apparent that
47 in the context of the culturally and linguistically Deaf prisoners, the inclusion of 'contribute to some positive
48 change' led to misconceptions about the scope of my role and authority. All of these individuals were
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 experiencing significant issues in prison as a consequence of a lack of resource allocation or Deaf awareness
4 (Kelly, 2017; 2018). Because of this they were severely isolated, frustrated and anxious, and desperate for
5 changes to be made. Thus, my mention of positive change led to an expectation that I would be able
6 implement alterations for them, and led to questions being asked as to when they would begin to see
7 improvements in provisions. Although I explained clearly that I did not have the authority to implement any
8 significant changes, this misconception created significant feelings of guilt, as shown below:
9
10
11
12
13

14
15 I have to say that the extent to which these people were desperate for my
16 help filled me with guilt, even after I had left. The reasons behind this guilt are
17 multi-faceted, and stem from the fact that I don't think that my research is
18 going to induce the level of change that they so desperately wish to see; They
19 were all so excited for today, and delighted that they would finally get to have
20 their say – But I can't help but think, I'm just a PhD student, is anything that I
21 say or do really going to change things for them? Making any big change to
22 the Prison Service seems so unlikely, and I know I am not aiming for any big
23 change, it is just hard to look people directly in the eye who are so desperate
24 for me to help them (Fieldwork journal, 7th May 2015).
25
26
27
28
29
30
31
32
33
34
35
36

37 The fact that my sample included prisoners and staff members meant that the process of effectively managing
38 participants' perceptions was difficult for other reasons as well, in that I had to try and appear simultaneously
39 trustworthy and 'on the side' of two distinct groups, whose values and principles are inherently conflicting
40 (Scott, 2006; Crewe, 2009; Stevens, 2013; Hammersley, 2015). While some prison researchers discuss having
41 significant problems negotiating a balance between the groups (Sparks et al., 1996; Stevens, 2013; Rowe,
42 2014), my experience was much more straightforward, and mirroring the experience of Crewe (2009),
43 cooperation from both groups meant that I did not feel required to choose between the two. However, in
44 instances where interviewees were critical of the behaviours of the other group, I was careful to be as
45 pragmatic as possible, and in order to do this I adopted Stevens' (2013) belief that it is "entirely possible to be
46 on 'both sides' but not at the same time" (pp. 44). I also made a continued effort to remain impartial if asked
47 about my opinions on prison-related matters, and to appear neutral even when I felt as though I was 'taking
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 sides' internally (Crewe, 2009; Stevens, 2013). While the research was clearly prisoner oriented, the inclusion
4
5 of staff members in the research sample certainly strengthened the validity of findings, in that on numerous
6
7 occasions their perceptions reinforced the data collected from the prisoners and often reaffirmed complaints
8
9 of discrimination and unfair treatment.

10
11 Even after attempting to ensure that any ambiguity about my identity was removed, my presence inevitably
12
13 altered the way that participants behaved (for similar findings, see also Jewkes, 2002; Phillips, 2012; Earle,
14
15 2014). While many prison researchers have found that their gender affected the way that participants
16
17 responded to them (Morris & Morris, 1963; Gelsthorpe, 1990; Liebling, 1999; Jewkes, 2002; Phillips, 2012;
18
19 Stevens, 2013), I did not feel as though this was the case. Yet, like Sloan and Wright (2015) I did suspect that
20
21 my age influenced the behaviour of certain participants, particularly staff members. On numerous occasions
22
23 participants asked about my age, and some also enquired as to whether I was an undergraduate student doing
24
25 my dissertation. This was frustrating as I felt as though participants were taking me less seriously than they
26
27 would an older, more experienced researcher.

28 29 **Recording and Transcription**

30
31 After discussing the interview process, consideration is now given to the process of recording and transcribing
32
33 the data, as this part of the research process was also littered with complications. All interviews were recorded
34
35 with a Dictaphone, and although this proved to be sufficient for 21 of the 28 interviews, problems arose when
36
37 the Dictaphone was used to record the interviews carried out with culturally and linguistically Deaf prisoners.
38
39 The visual nature of BSL meant that the original data generated during these interviews were in a visual rather
40
41 than verbal form, and thus the Dictaphone recorded only the interpreter's mediated version of the responses
42
43 rather than the original responses themselves. I was conscious of this prior to applying for NOMS approval,
44
45 and within my application indicated that the use of a visual recording device would be preferential, for
46
47 ensuring complete authenticity (Atherton et al., 2001; Young & Hunt, 2011; Stone & West, 2012; Wilson &
48
49 Winiarczyk, 2014). Despite this request, none of the establishments included in the research were willing to
50
51 allow me to bring in a video recorder, which meant that a Dictaphone had to suffice.

52
53 While an audio recording would have been sufficient if I could have guaranteed that the interpreter was
54
55 providing an exact translation of the interactions, in reality such an assurance was not possible (for discussions
56
57
58
59
60

1
2
3 on this see Roy, 1992; Wadensjö, 1998; Atherton, et al., 2001; Harrington & Turner, 2001; Young & Hunt, 2011;
4 Stone & West, 2012). Rather, the interpreter was the only party who could understand both myself and the
5 participant. Consequently, the extent to which the data collected was authentic hinged largely upon the
6 interpreter's performance during the interview (Harrington & Turner, 2001; Stone & West, 2012). Therefore, in
7 order to minimise any issues that could arise in relation to this it was important to ensure that the interpreter
8 used was both sufficiently qualified and reputable.
9

10
11
12
13
14
15 As previously noted, two interpreters were used during the research process, both of whom were fully
16 qualified and registered with the *National Registers of Communication Professionals working with Deaf and*
17 *Deaf blind People (NRCPD)*¹³. The fact that the primary interpreter was also one of my PhD supervisors meant
18 that he was aware of the nature of the research and the role that he would be taking. However, because an
19 external interpreter was utilised at one establishment, it was important to ensure that she was clear about the
20 aims of the research and the remit of her role. In order to do this, copies of the relevant interview schedule,
21 information sheet and consent form were sent to her beforehand. I also made sure to contact her via phone
22 and email in the days prior to the interview to ensure that any queries or issues that she may have had
23 regarding the research were resolved. She was made aware of the use of a Dictaphone, and that she must
24 interpret clearly in order to ensure that her voice was decipherable on the recording. After the interview was
25 over I then gave her the opportunity to discuss any issues that she may have had during the interview process,
26 of which there were none.
27
28
29
30
31
32
33
34
35
36
37

38
39 After they were completed, all of the interviews were transcribed with the aim of being as close to verbatim as
40 possible. Although the majority of the recordings were transcribed with relative ease, the interviews that took
41 place with a number of the culturally Deaf prisoners proved to be extremely difficult to transcribe, in that as
42 well as using BSL to communicate, some Deaf people choose to verbalise simultaneously¹⁴. This was
43 problematic for transcribing because the verbalisations of a number of the participants were often unclear,
44
45
46
47
48

49
50 ¹³ The NRCPD is a service which "exists to protect the public by regulating communication and language professionals who
51 work with deaf and deafblind people" by holding registers of these people (NRCPDa, N.D: Unpaginated). In order to
52 become registered with the NRCPD an individual must have successfully completed an approved course, must continue
53 their professional development and must abide by the Code of Conduct as outlined by the service. This code of conduct
54 outlines expectations for how registered professionals must behave if they are to remain on the register, and requires
55 them to act completely impartially in all interpreting settings, translating faithfully and accurately to the best of his/her
56 ability without adding or taking anything away from the source message (NRCPDb, N.D).

57 ¹⁴ A primary reason for this is that they had been taught to speak as children in hearing schools or by hearing parents
58 (Marschark, 2009).
59
60

1
2
3 and at times completely incomprehensible. While this was not troublesome in and of itself, participants often
4 talked over the interpreter's translation of their BSL which meant that when transcribing the data, I could not
5 decipher what the interpreter was saying because I could only hear the verbalisations of the Deaf individual. In
6 order to overcome this, I listened to certain extracts repeatedly at a slower speed, which on many occasions
7 allowed me to make out what was being said. However, even after being listened to by a BSL interpreter
8 (interpreters are seen as being more equipped to comprehend Deaf voices), a number of extracts remained
9 indecipherable and therefore had to be omitted from the transcripts.

10
11
12
13
14
15
16
17 Transcription was particularly difficult in the context of the group interview. Because it was organised on the
18 spur of the moment, we (myself and the interpreter) had little opportunity to discuss ways of ensuring that the
19 interpretations would be as clear as possible on the recording. In an attempt to alleviate issues of
20 indecipherability, immediately prior to the interview we agreed that he would state the name of the
21 participant he was interpreting for at the beginning of each interpretation. However, once the interview
22 started it became clear that he was going to struggle to provide all the necessary translations because of the
23 way the participants were communicating. Despite all being Deaf, each interviewee had a slightly different way
24 of interacting; two participants signed and spoke (P1B and P5B), one relied entirely on BSL (P2B), and one
25 signed whilst vocalising very loudly and incoherently (P4B). This meant that the interview was comprised of
26 extremely complex interactions, which made effective and accurate interpreting difficult. For example, at one-
27 point the interpreter was translating the spoken words of P1B to P2B and P4B who only used BSL, and while
28 this alone may have been fine, I found P1B's voice extremely difficult to decipher and therefore was forced to
29 say "Pardon?" whilst the interpreter was interpreting. At this point he would have to come in and translate the
30 words for me, and therefore was simultaneously interpreting for both me and a number of the participants.
31 This meant that there was little opportunity to state the participant's names at the beginning of each
32 interpretation, and therefore when listening back to the recording, it was difficult to decipher who was saying
33 what. Furthermore, again the fact that a number of the participants vocalised as well as signing meant that on
34 the recording, not only were complex and flurried interpretations taking place, but they were being obscured
35 by the voices of the Deaf participants. In consequence, while most of the recording was successfully
36 transcribed, in instances of uncertainty I was again forced to omit certain extracts.

Ethics

Ethical approval to carry out the research was obtained from NOMS in October 2014, and UCLan in November 2014, and all relevant ethical guidelines were followed during the research process. While confidentiality, anonymity, consent and the welfare of participants were all important ethical considerations, focus is given here to those that relate specifically to doing research with d/Deaf prisoners, the first of which relates to consent. In order to ensure that all participants were fully informed about the nature of the research, an information sheet disclosing all the relevant information about the study and a consent form were sent to each establishment at least two weeks prior to my date of entrance (something which was also stipulated by NOMS as a condition of the research approval). In order to ensure that the documents were accessible to the culturally and linguistically Deaf participants (who often cannot read or write), visual copies were also made available (for discussions on this see Young & Hunt, 2011). The creation of these involved an interpreter being videoed translating the information into BSL, whilst another person simultaneously read the contents aloud in English. The reason that the content was also verbalised was to avoid potential security issues that could arise as a result of a document entering the prison and being made available to prisoners, that staff members could not understand. Despite this provision, none of the prisons involved in the research made these recordings available to potential participants. In all instances I was advised that establishments were unable to show the video to participants because of either security restrictions or a lack of available facilities. Consequently, a number the Deaf participants were only able to give informed consent on the day of the interview when the interpreter was able to translate the necessary information into BSL for them, thus meaning that the prisons themselves were violating the stipulations of NOMS.

Another important ethical consideration related to the welfare of participants. It was anticipated that discussions around the pains of imprisonment and communication isolation might provoke feelings of distress/anxiety. In order to ensure that this was kept to a minimum, participants were advised in the information sheet and at the start of the interview that their participation was voluntary, and that the interview could be paused or terminated at any time if they so wished. This ethical consideration was most applicable to one Deaf participant who became very upset when discussing his experience in prison. On multiple occasions I asked him if he was okay, and advised that we did not have to carry on with the interview.

1
2
3 However, despite being outwardly distressed he was adamant that we needed to continue because he wanted
4 to do all he could to improve the situation for Deaf prisoners in the future. Such distress was very difficult and
5 upsetting to witness, whilst also being difficult to manage, as shown here in an extract from my fieldwork
6 journal; "I found it very difficult to know how to react without seeming insincere. I desperately wanted him to
7 know that I did actually care about what he was saying, and that it was affecting me, but again felt helpless as
8 to what I could do to counteract such pain" (7th May 2015).

9
10
11 Also relevant to the welfare of participants was the option of aftercare for individuals who became distressed
12 during the interview. Interviewees were advised within the information sheet that I would be able to supply
13 information regarding avenues of support if they so wished. This became relevant six months after the
14 fieldwork period had ended when I provided one Deaf participant with information regarding appropriate
15 support avenues. This individual had written to me on numerous occasions after the interview, and within his
16 letters indicated that he felt very lonely and isolated in prison as a consequence of his Deafness. He also wrote
17 about having minimal contact with family members and feeling relieved that he had somebody to talk to about
18 his life. Although I did respond to him on numerous occasions, I felt that I was not equipped to provide the
19 emotional support that he was looking for, as highlighted in the following extract from my fieldwork journal:

20
21
22
23
24
25
26
27
28
29
30
31
32
33 After receiving the letter, I agonised over how best to respond; not wanting to
34 seem offhand and uncaring, but at the same time anxious about appearing over
35 personal or 'too friendly'. While I wanted to support this prisoner and help him
36 through what I knew was a horrible time, within what appeared largely to be a
37 traumatic life, I didn't want to create the wrong impression, and 'lead him on', in
38 that I didn't want him to think it could be a friendship because that wouldn't be
39 appropriate given the context of the situation. Or would it? I am still in a dilemma
40 whilst writing this over a month later - I just couldn't decide what to do because
41 this guy had poured his heart out to me, and I felt like I wouldn't be able to give
42 enough back (23rd March 2015).

43
44
45
46
47
48
49
50
51
52
53 After discussing the situation with my supervisory team, I wrote to the individual advising him of the existence
54 of a befriending service provided by an external organisation (New Bridge Foundation, 2016) which I thought

1
2
3 could potentially help to reduce some of the isolation he was feeling. Instances such as this provoked feelings
4 of moral and ethical contradiction as although I had done my utmost to avoid compromising the welfare of my
5 participants, I felt as though involvement in my research may have had negative repercussions in the long term
6 for him (for similar findings, see also Scraton & Moore, 2013; Crewe & levins, 2015)
7
8
9

10 **Protecting Against the Inevitable: Subjectivity**

11
12
13
14 After considering the intricacies of the interview process and the complexities of carrying out research with
15 d/Deaf people in prison, the impact that I, the researcher, had on the research is now discussed. Before the
16 fieldwork began I was conscious that if I wanted to address my research aims I would need to create an
17 accurate picture of the participants' realities and responses (Morris & Morris, 1963; Scott, 2006). My priority
18 was to ensure that the views of the participants remained at the heart of the research, and that if they were
19 to see it, the interviewees would be able to relate to the findings (Scott, 2015a). However, completely
20 neutrality in qualitative social research is of course impossible, and rather an individual's research is inevitably
21 shaped by their values, attitudes and interpretations, and unavoidably considered through their own unique
22 biographical lens (Cohen & Taylor, 1972; King & Elliott, 1977; Genders & Player, 1995; Liebling, 1999; Phillips,
23 2012; Hammersley, 2015; Scott, 2015b). This became evident during my second visit to HMP Bowdon, where I
24 realised that my unconscious opinions regarding d/Deafness had influenced the way that I had viewed the
25 participants during my first visit, as detailed in the following extract from my fieldwork journal:
26

36
37
38 When one of the psychology staff members spoke of P1B being very manipulative
39 during one to one sessions with her, and crying in order to get himself 'out of
40 trouble' I couldn't help but feel shocked. In my head, despite consciously trying not
41 to, I had oversimplified the characters of the Deaf prisoners I had interviewed, and
42 found it difficult to comprehend them being manipulative or vicious purely
43 because they were Deaf. This was extremely frustrating as it brought home to me
44 that I am still a member of the hearing world no matter how much I try to separate
45 myself. No matter what I do, I will never be Deaf, and am unlikely ever to be able
46 to rid myself of these ingrained perceptions of 'deafness' and 'difference' and
47 'disability' (16th March 2015).

1
2
3
4
5 Despite my quest to remain impartial, I often found myself in situations with which I was morally
6
7 uncomfortable, and in line with experiences of other researchers (Morris, 1967; Genders & Player, 1995;
8
9 Phillips, 2012; Stevens, 2013; Jewkes, 2014; Scott, 2015b) at times found it difficult to suppress subjective
10
11 reactions that may have in turn compromised the quality of the data. There were a variety of different
12
13 contexts where this was the case, the first being in instances where individuals were behaving in a way that I
14
15 perceived as unacceptable. While almost all of the interviewees expressed opinions that I did not agree with, I
16
17 knew that for the purposes of the research it was not my place to respond with my own subjective
18
19 perceptions, and therefore did not find this too troublesome. However, on a number of occasions I observed
20
21 behaviours and interactions whilst being guided around the establishments that I found difficult to ignore.
22
23 Despite this, in order to ensure that the research process went as smoothly as possible I adhered to what
24
25 Jewkes (2014) refers to as an “unwritten professional code [to]... remain silent on the matter” (pp. 389) at all
26
27 times.

28
29 Furthermore, throughout the research process I found it extremely hard to avoid becoming preoccupied with
30
31 the nature of the offences committed by the participants (see also Stevens, 2013). While I did not ask the
32
33 participants about the nature of their convictions, staff members often told me before the interview started,
34
35 and although a serious conviction was not a prerequisite of the research, throughout the research process it
36
37 became apparent that 12 of the prisoners included in the sample were either in prison for murder or sex
38
39 offences against children. However, because I did not ask the prisoners about their offences, for the most part
40
41 I was spared the 'gory details' that other researchers discussed having to process (Phillips, 2012; Stevens,
42
43 2013; Jewkes, 2014). On the contrary, what I was met with were individuals who, on face value, appeared to
44
45 be fairly 'normal', and certainly not the 'monsters' that I was partially expecting. The impact that this had on
46
47 me is emphasised in the following extract from my fieldwork journal:

48
49 I found today a very surreal experience. Although I was outwardly maintaining a
50
51 neutral stance, inwardly I was, and still am struggling to make sense of how or why
52
53 these people would commit a sex offence. I find it mentally disorienting when
54
55 thinking about the fact that these complex human beings with thoughts and
56
57
58
59
60

1
2
3 emotions who seem so 'normal' had all committed terrible offences (19th February
4
5 2015).
6
7

8 Not only was this difficult mentally, but at times there was also a danger of it affecting the interviews. On a
9
10 number of occasions, I had to consciously fight the desire to question the participants about the details of their
11
12 offences in a bid to gain an understanding of the motives behind them. The fact that the prisoners often
13
14 appeared so 'normal ' also made the research experience more emotionally challenging than I had anticipated,
15
16 because it became difficult to rationalise the pain that they were experiencing. This is shown in the following
17
18 extract from my fieldwork journal:
19

20
21 Again, I struggled mentally during my time with P5B. When he was discussing the
22
23 problems that he had had throughout his life I just felt awful for him. I found it
24
25 very sad that he spoke of always being isolated, and feeling uncomfortable in the
26
27 presence of others. He was very honest during the interview and at the end, he
28
29 said that he had been extremely nervous beforehand and had been shaking. I
30
31 couldn't help but warm to him, but then, again felt very mentally disoriented and
32
33 strange because he was a repeated child sex offender. After this interview was
34
35 over, I was completely exhausted, and felt depressed and upset at what the
36
37 prisoner had told me (16th March 2015).
38
39

40 Once I had actually experienced the prison environment for myself I began to understand why prison
41
42 researchers (for example Liebling, 2001; Bosworth et al., 2005; Phillips, 2012; Stevens, 2013; Crewe, 2014;
43
44 Drake & Harvey, 2014; Earle, 2014; Jewkes, 2014; Piacentini, 2015) are now devoting increasing amounts of
45
46 time to discussing the role that emotions play in the research process. I found the whole fieldwork experience
47
48 to be emotionally exhausting and more mentally testing than I had ever imagined, and I would often leave
49
50 interviews feeling physically sick and mentally overwhelmed. Although I was theoretically prepared for what I
51
52 might see/hear in prison, in reality seeing the pains experienced by d/Deaf prisoners through my own eyes was
53
54 very different from reading about them on paper, and in hindsight I was not prepared to be exposed to real
55
56 human suffering in the way that I was.
57
58
59
60

1
2
3 While experiencing such feelings was difficult, it arguably enhanced the quality and depth of the research
4 (Sloan & Drake, 2013), in that in certain instances my emotions acted as what Jewkes (2012) calls an
5 “intellectual resource” (pp. 66). By being “emotionally sensitive” (Crewe, 2014, pp. 426), I was able to
6
7 empathise with the feelings of participants in a way that helped me to gain more insight into their lived
8
9 realities. However, I was also aware that emotional involvement on the part of the researcher can have the
10
11 potential to undermine the authenticity of their research if it is not adequately regulated, as an individual can
12
13 begin to prioritise the opinions of participants with whom they empathise with the most at the expense of
14
15 others (Sparks et al., 1996, Stevens, 2013). Therefore, to ensure that the data was as accurate as possible and
16
17 to avoid becoming “contaminated by sympathy” (Ruess, 2000, pp. 40) I implemented what Crewe (2014) calls
18
19 “reflexive interrogation” (pp. 394). During this process I regularly critically reflected on my emotions and
20
21 standpoint in a variety of ways; internally, with my supervision team and by keeping a fieldwork journal.
22
23 Through this continuous critical self-reflection I was able to keep sight of the fact that my overarching priority
24
25 was to address my research aims, and that although subjectivity was inevitable, and empathy was natural and
26
27 even useful, I needed to maintain a professional boundary between myself and the participants.
28
29

30 **Concluding Remarks and Recommendations**

31
32 This article has provided an outline of my experience of doing research with d/Deaf people in prison, including
33
34 the process of gaining access, the interviews, ethics, recording and transcription and the management of
35
36 inevitable subjectivity. It is evident that the research process was laden with complex obstacles, some of which
37
38 mapped onto those of other researchers and were produced by the nature of the environment itself, and
39
40 others that went beyond this. The fact that this study is the first in England and Wales to include semi-
41
42 structured interviews with multiple d/Deaf prisoners (excluding small-scale unpublished undergraduate
43
44 dissertations), meant that it was methodologically unique. This introduced uncertainty and generated an array
45
46 of additional hurdles, as have been discussed throughout. A key hurdle related to access; without a meaningful
47
48 mechanism in place for recording d/Deaf prisoner numbers it was extremely hard to locate appropriate
49
50 research participants. This, combined with a lack of d/Deaf awareness on the part of allocated contacts led to
51
52 the eventual widening of the research sample to include prisoners across the hearing-Deaf spectrum. Further
53
54 methodological complications arose as a result of the language barriers between myself and the Deaf
55
56 prisoners, with their preference for a visual language making the process of ensuring that the research was
57
58
59
60

1
2
3 both ethical and authentic more difficult than it otherwise would have been. Such difficulties were
4
5 compounded by the fact that I was not able to bring visual recording devices into establishments, nor were the
6
7 Deaf participants given access to visual copies of my consent forms and information sheets.
8
9

10 My experiences provide a framework for prospective researchers on how to carry out research with d/Deaf
11
12 people in prison. While existing sources have examined the process of doing research with d/Deaf people and
13
14 in prisons separately, the process involved when the two scenarios combine has not previously been
15
16 documented. Thus, by discussing how to go about carrying out research in a heavily regulated, secure
17
18 environment like prison with a sample of d/Deaf people with culturally distinct norms and language, this
19
20 article makes a significant contribution to qualitative research methods literature. The inclusion of a
21
22 transparent account of the methodological issues I faced is particularly noteworthy, in that it will allow future
23
24 researchers to anticipate such issues before they arise, thus simplifying the process and enabling them to
25
26 prepare accordingly. The fact that the research process documented my journey as a hearing person with little
27
28 comprehension of BSL means that the article is of most obvious significance for other hearing researchers.
29
30 However, it is of value to Deaf scholars too given that many of the methodological complications I faced were
31
32 generated by the nature of the prison environment as a research setting rather than my hearing
33
34 status/language preference. As such, discussions about access, recording, researcher identity, subjectivity and
35
36 ethics will also be of significance to Deaf researchers. However, it is likely that the Deaf status of such
37
38 individuals will alter the way that these methodological complications are experienced, thus making
39
40 publications in this area a necessity.
41
42

43 What follows now is a list of recommendations I would extend to others considering doing research with
44
45 d/Deaf prisoners:
46

- 47 1. A year was allocated for gaining access and carrying out the fieldwork during this research, which was much
48
49 too short. The process of locating appropriate participants took much longer than expected, as did liaising with
50
51 individual prisons and organising interviews. Consequently, after the fieldwork period had ended,
52
53 establishments continued to express an interest in being involved, and although such involvement may have
54
55 enhanced the quality of the data collected, time constraints meant that I had to decline offers of interviews.
56
57
58
59
60

- 1
2
3 Thus, it is recommended that future researchers carry out larger projects with more leeway in terms of
4
5 timescales.
- 6
7 2. The dual process of gaining NOMS clearance and ethical approval from the University was particularly difficult
8
9 during this research because neither would give approval without evidence of approval from the other. To
10
11 combat this, individuals can obtain 'approval in principle' from the relevant ethics committee prior to being
12
13 awarded clearance by NOMS (now HMPPS). Once clearance to carry out research in prisons is awarded, a full
14
15 ethics application can then be submitted.
- 16
17 3. If a BSL interpreter is being used in interviews with culturally and linguistically Deaf participants, it is
18
19 imperative that they are registered with the NRCPPD, and preferable that they have experience with
20
21 interpreting in environments like prison. Researchers must also ensure that interpreters are sufficiently briefed
22
23 about the research and the remit of their role before any interviews are carried out.
- 24
25 4. It is recommended that where at all possible, all interviews with culturally and linguistically Deaf prisoners are
26
27 recorded via a visual recording device. In instances where an interpreter is being used, this would ensure
28
29 complete authenticity rather than merely recording the interpreter's interpretation of the raw data (which is
30
31 what a Dictaphone does). This would also be beneficial for transcription, as it would mean that a copy of the
32
33 raw data would be available for the researcher to refer back to after the fieldwork period is over, thus
34
35 minimising the margin for error. It would also eliminate issues with regards to Deaf participants speaking over
36
37 the interpreter's translation of their BSL, which, in this research made certain interpretations indecipherable. If
38
39 the option to visually record an interview with a Deaf person is not available, it is recommended that two
40
41 Dictaphones could be used instead; one to record the interview, and another to record the
42
43 researcher's/interpreter's¹⁵ dialogue during the interview. In order to do this, the interpreter would need to
44
45 plug a headset into the Dictaphone (or use a wireless equivalent), which would enable the recording to be
46
47 focused around their voice, thus preventing any distortion.
- 48
49 5. In order to collect sufficiently rich data from Deaf prisoners, it is recommended that where feasible,
50
51 participants are interviewed in groups as well as individually. In the context of this research Deaf participants
52
53 were much more open and engaged when discussing their experiences with others who were Deaf. If group
54
55 interviews are carried out, it would be beneficial to utilise the services of multiple interpreters, as this would
56
57 be make it easier for complex and flurried conversations to be interpreted comprehensively.

58
59
60 ¹⁵ If the researcher was able to communicate fluently in BSL, then an interpreter would not necessarily be required.

- 1
2
3 6. To ensure that the research is ethical, Deaf participants should be provided with visual copies of information
4 sheets and consent forms prior to being interviewed. In order to prevent establishments declining to do this,
5 the importance of this must be made explicit in any application documents.
