1 KEY MESSAGES

- 2
- Little is known about the rates of expressing breast milk and the use of breast pumps after birth
- 3
- The high response rate to this on-line survey demonstrates the importance of breast pump
- 4 service provision to recent mothers, most of whom had experience of trying to express breast
- 5 milk.
- A free breast pump hire (rental or loan) service, providing choice of high quality electric pumps
- 6 and skilled professional support is preferred to provision of a free pump worth £40 to keep, with
- 7 vouchers for either proposed to maximize choice.
- To inform the development of a free breast pump service intervention prior to future
- 8
- 9 evaluation: women raise concerns around the impact on feeding outcomes, professional
- 10 support, hygiene for hired pumps, and costs.
- A free breast pump service is as an acceptable incentive strategy which could be further
- 11
- 12 developed and tested for effectiveness and impact on health inequalities
- 13
- 14
- 15

16 **Abstract**

17 Improving breastfeeding outcomes is a global priority, however, in the UK continuation of breastfeeding
18 remains low. Growing empirical evidence suggests a free breast pump service might be an acceptable
19 and feasible incentive intervention to improve breastfeeding outcomes and reduce health inequalities.

20 To inform intervention development we conducted an on-line survey with women recruited via social
21 media using snowball sampling. Data were analysed descriptively (closed questions) with qualitative
22 thematic analysis (free text).

23 The survey was completed by 666 women, most of whom had recently breastfed and used a breast
24 pump. Participants agreed that free pump hire (rental/loan) (567 women; 85.1%) or a free pump to keep
25 (408; 61.3%) should be provided. Free text comments provided by 408 women (free pump) and 309
26 women (free hire) highlighted potential benefits: helping women to continue breastfeeding, express
27 milk; overcome difficulties; and pump choice. Concerns are possible effect on breastmilk supply,
28 reduced breastfeeding, pumps replacing good support for breastfeeding and pump hire hygiene.
29 Personal and societal costs are important issues. Some suggested a pump service should be for low-
30 income mothers, those with feeding difficulties or sick/preterm infants. A one-size service would not suit
31 all and vouchers were proposed. Some suggested fees and deposits to prevent waste.

32 To our knowledge this is the first study reporting views about the acceptability of providing a free breast
33 pump hire service. Mothers support and wish to have a say in breast pump service development. Future
34 evaluations should address impact on feeding outcomes, professional support, hygiene for hired pumps,
35 and costs.

39 **Introduction (article = 6741)**

40 Improving breastfeeding rates is an international and national priority for infant and maternal health
41 (World Health Organisation (WHO), 2014; Rollins et al, 2016; Scottish Government 2017). The WHO
42 recommends exclusive breastfeeding for the first six months of life (WHO, 2003); however in the UK less
43 than 1% of mother-infant dyads meet this goal (Health & Social Care Information Centre (HSISC), 2012).
44 Breastfeeding rates in Scotland are amongst the lowest in Europe and have been relatively resistant to
45 change since 2001/2. The most recent data (Information Services Division (ISD), 2017a) indicate a
46 decline in exclusive breastfeeding and an increase in mixed (breast and infant formula) feeding at 10
47 days after birth but small increases in mixed or exclusive breastfeeding at 6-8 weeks. New initiatives are
48 therefore required particularly in the early days after birth.

49 Breastfeeding women want choices in how to feed their babies and many also choose to express breast-
50 milk or give infant formula. These choices are not equal in terms of accessibility and outcome. Health
51 inequalities are evident because mixed feeding is socially patterned and associated with shorter overall
52 breastfeeding duration (HSISC, 2012). Choices can be subject to health service rules about the 'right'
53 way to feed (Hoddinott et al., 2010), which frequently lack high quality evidence and can undermine
54 women's feeding decisions. For example, in the UK hand expressing is recommended for mothers
55 wishing to express for a health term infant in the early days (<https://www.unicef.org.uk/babyfriendly/>)
56 but there is insufficient good quality evidence to support this as randomized controlled trials in term
57 infants have been small (Becker et al., 2016, Meier, 2016). Many women prefer to use a pump (Clemons
58 & Amir, 2010; Rasmussen & Geraghty, 2011; Labiner-Wolfe et al., 2008) and find hand expressing
59 unpleasant or difficult to master (McInnes & Chambers, 2006).

60 Studies in Australia and USA report increasing prevalence of expressing breast milk (Binns et al, 2006;
61 Clemons & Amir, 2010) and the use of breast pumps appears common (Rasmussen & Geraghty, 2011;

62 Labiner-Wolfe et al., 2008). However, others challenge this perception due to lack of high quality data
63 from actual measurement of rates of expressing breast-milk (Johns et al., 2013). A study in the USA
64 showed that around 85% of USA breastfeeding mothers had expressed breast-milk in the first 4 months
65 in 2005-07, mainly using electric pumps (Labiner-Wolfe et al., 2008). An Australian study found that 47%
66 of infants had received expressed breast-milk in the first 2 days of life and that 48% of primiparous
67 mothers had acquired a breast pump before birth (Johns et al., 2013). Qualitative research in Scotland
68 (Hoddinott et al., 2010) illustrates that expressing milk and breast pumps are important issues and that
69 women are dissatisfied with current health service support for expressing breast-milk. Importantly, the
70 UK prevalence for expressing breast-milk and pump use is currently unknown

71 Previous research by our team includes a systematic review of seven studies evaluating the effects of a
72 free breast pump on breastfeeding rates with various comparators, which had inconclusive findings
73 (Moran et al., 2015). The studies in the review were all based in the USA and varied considerably, e.g.
74 type of pump, stage of recruitment (pregnancy, post birth, returning to work), control group (e.g. other
75 childbirth related items, infant formula) and outcomes (measurement points and how reported) (Moran
76 et al., 2015). There have been no UK based studies of breast pump provision therefore the effects on
77 breastfeeding outcomes in this context are unknown. Surveys of Early Years Health Professionals and of
78 the UK public investigated the acceptability of different incentive strategies to improve breastfeeding
79 outcomes. The surveys found that NHS provision of a free breast pump worth £40 was more acceptable
80 than shopping voucher for mothers who prove they are breastfeeding, but there were mixed views on
81 the acceptability (Crossland et al., 2016).

82 Earlier research (Hoddinott et al., 2012; McInnes et al., 2014) showed that women's feeding decisions
83 were driven by the goal of family wellbeing rather than goals for the duration or exclusivity of
84 breastfeeding. Pivotal points occur after birth where feeding changes in order to try to restore family

85 wellbeing, such as the introduction of infant formula, expressing breast-milk or stopping breastfeeding
86 completely. UK survey data show that over 30% of new mothers supplement with infant formula while
87 in hospital (HSCISC, 2012). Mothers highlighted two stages or reasons for expressing or using a pump:
88 firstly to overcome breastfeeding difficulties in the first 1-2 weeks; and secondly to enable them to meet
89 their own feeding and family well-being goals such as 'time out' or involving others in baby feeding
90 (Hoddinott et al., 2010; McInnes et al., 2014, Crossland et al.,2016).

91 Complex interventions, such as those designed to change infant feeding behaviour, require involvement
92 of the target population who the intervention seeks to benefit. The aim of the study was to find out
93 women's views about providing a free breast pump service as a first step towards informing the design
94 of a complex intervention for future testing. It builds on the knowledge gained from our previous study
95 that investigated incentive strategies for breastfeeding (Morgan et al., 2015; Crossland et al., 2016) by
96 asking new questions about the acceptability of a free breast pump hire service and women's
97 experiences of using a breast pump. The term breast pump hire is used in this article because when this
98 survey was conducted, the options available for parents of healthy term infants in the UK who choose to
99 use a breast pump were either to buy their own pump or to hire a pump. In other countries a hire
100 service is referred to as a rental service. A free hire service would also be the equivalent of a loan of a
101 breast pump at no cost to the woman, with the expectation that it would be returned at a later date.

102 **Methods**

103 The study method was an on-line survey that aimed to elicit opinions on breast pump interventions,
104 breast pump use and expressing breast milk as well as information on individual experience of
105 expressing, health service support and participant demographics. The survey introduction page invited
106 invited women who self-identified as having given birth in the past 5 years to participate.

107 **Survey design and piloting**

108 The survey tool was informed by our previous qualitative and mixed methods research with families
109 (Hoddinott et al., 2010; Moran et al., 2015; Morgan et al., 2015; Crossland et al., 2016). Questions
110 relating to the acceptability of a service providing a free breast pump, worth around £40 (around US\$53)
111 and demographic questions were worded similarly to the Benefits of Incentives for Breastfeeding and
112 Smoking cessation (BIBS) study surveys (Crossland et al., 2015). In the BIBS study, the survey was
113 designed by synthesising evidence from systematic reviews, acceptability surveys of the UK public and
114 early years health professionals, and qualitative interview data with pregnant and recent parents and
115 early years health professionals. Input from members of two mother and baby groups, both in
116 disadvantaged areas, informed all aspects of the design and conduct of the BIBS study (Morgan et al.,
117 2016).

118 For our survey, new questions were added to the BIBS study questionnaire to ask about the
119 acceptability of a breast pump hire service, experiences of expressing breast-milk and pump use, pump
120 preference, timing and any health service support received. The survey was piloted for acceptability and
121 face validity with mothers of a local breastfeeding group that had not been involved in the BIBS study,
122 who had agreed to provide feedback.

123 The final survey tool comprised 16 closed questions with the opportunity to comment in optional free-
124 text boxes. A copy is available via supplementary files. The survey was hosted by the Bristol on-line
125 platform (<https://www.onlinesurveys.ac.uk/>). Survey architecture aimed to minimise participant burden
126 through the use of Yes/No answers, tick boxes, Likert type scales and bypassing non-applicable
127 questions. Provision of demographic data was optional and the survey was designed to take around 10-
128 20 minutes to complete, depending on the number of free-text comments.

129 **Population and context**

130 The survey was targeted at women who live and had given birth in the UK within the previous 5 years.
131 Within this setting women can buy their own pumps or pay to hire pumps via a range of retail or
132 charitable organisations, such as the National Childbirth Trust (NCT: <https://www.nct.org.uk/>). The cost
133 of a buying a breast pump depends on type and quality; for example buying a hand pump from an online
134 retailer could cost from around £10-170 while an electric pump might cost from £26-£340 (double or
135 single options) [all prices correct on 02/03/18]. The cost of pump hire also varies depending on source,
136 type of pump and inclusion of collecting sets; for example two retail outlets charge from £47-65 for an
137 initial period (2-4 weeks) and a similar 30-day fee thereafter [correct on 02/03/2018]. Similar costs were
138 noted for hiring through the NCT (£44-£48 for first month and £26 per month thereafter). In the NHS in
139 Scotland, free or low cost pump hire is available for some women (e.g. mothers of infants in neonatal
140 units) in some Health Board areas, but this service varies considerably in terms of number of pumps
141 available, pump type, eligibility, duration of loan and cost (e.g. sometimes a small charge or deposit is
142 required). The potential for health inequalities in access to a breast pump are a concern (Morgan et al.,
143 2015).

144

145 **Data Collection, Sample and Recruitment**

146 The survey was open from 15/01/2016 until 21/06/2016. Snowball sampling (Noy, 2008) was used
147 where the survey link was posted and reposted on a number of social media outlets including Netmums,
148 University portals and distributed to mother and baby groups via infant feeding networks in Scotland
149 and the north of England. Respondents were encouraged to share the link with their family and friends
150 in the target population. Participants were invited to opt in to a prize draw for one of four shopping
151 vouchers worth £50 (vouchers could be exchanged for goods in a range of local shops or on-line).
152 Participation in both the survey and the prize draw were voluntary.

153 Analysis

154 All survey responses were exported to an Excel spreadsheet and were analysed descriptively. This
155 included women's infant feeding practices and opinions about the proposed breast pump incentive
156 interventions. Free text data for the responses to the two service options (Free Pump and Free Hire)
157 were imported into NVivo where the comments were read and categorised according to content. Most,
158 but not all, comments were short, comprised lists or were in the format of 'a great idea but.....'.
159 Categories of data were then grouped into the key themes. Data on the free pump were initially
160 analysed by one author (RM) and themes discussed and agreed with a second (NG). Then data on the
161 pump hire were analysed by the second author (NG) and reviewed by the first author (RM). Both
162 authors then discussed the similarities and differences in the themes arising from both data sets. As our
163 team has already published views on provision of a free breast pump (Morgan et al., 2015; Crossland et
164 al., 2016), the analysis focused on new emergent themes and views about a free breast pump hire
165 service. Findings from the survey were presented to the wider team for comment and further
166 discussion, which were then used to inform our analysis and this paper. Illustrative quotes for the key
167 themes are included in the results section. Quotes are transcribed verbatim, with the respondents'
168 punctuation and emphasis e.g. capital letters. Short quotes within the text are in italics and longer
169 quotes are followed by a number, which relates to the participant's survey response and whether they
170 were commenting on the free pump or free hire question

171 Ethics

172 Ethics approval was granted by the University of Stirling Ethics committee (SREC 15/16- Paper no 44
173 approved 9th December 2015) and the principles of good research governance were followed. The email
174 addresses provided for the prize draw had the potential to identify individuals. The draw was

175 administered by an independent person separate from the research team and downloaded data for the
176 draw was destroyed on completion. No other identifying data were collected.

177 **Results**

178 Table 1 presents the characteristics of the 666 women who completed the survey. Sixty-nine completed
179 the pilot survey between August-September 2015 and 597 completed the survey between January-July
180 2016. As no changes were made to the survey after the pilot phase, the results are included with the
181 main survey results. Full demographic data were provided by 99% of participants and indicated that the
182 sample over-represents older (70% aged over 31 years) and more educated women (78% were still in
183 full time education at the age of 19). Around half the participants were from Scotland, half had one baby
184 and only four had never breastfed. The majority of women completing the survey had expressed breast-
185 milk and used a breast pump (>97%). Table 1 and 2 also present sample characteristics by response to
186 agreement on an offer of a free pump or free hire service.

187 ***Table 1: Sample demographics***

188

189 **Experience of using a breast pump**

190 Of the 649 women who had used a pump, 50% had experience of both electric and manual pumps; 37%
191 had only used an electric pump and 14% had only used a manual/hand pump. The majority of women
192 who used a breast pump had healthy infants born at term (n=587, 90.5%). Women indicated a range of
193 time points after birth when they started using a breast pump with around 45% (n=295) beginning
194 within the first week of their baby's life, Table 2.

195 ***Table 2: Time point and circumstances of first breast pump use, N=649 (%)***

196

197 Many of the mothers reflected on their own experience and highlighted their perceptions of the
198 importance of access to a pump in the early days to *'help to preserve milk supply'*:

199 *Definitely, a good breast pump can make all the difference in the early days.*

200 (Participant 14057443 - commenting on Pump Hire)

201 In relation to early access to pumps women wanted easy access and health professional involvement for
202 example *'shown how to use it correctly'* or *'given to mum before leaving hospital and given instructions*
203 *on how to use it'*.

204 *... but there shouldn't be hurdles in the way (e.g. mums shouldn't have to PROVE there is a*
205 *problem)* (11272119 – Pump Hire)

206 In response to the question, thinking about the advice or help that you received when you first tried to
207 use a breast pump, 46% (n=295) had received no help. The 354 women who reported that they had
208 received advice or help rated this on a scale of 1 (very unhelpful) to 10 (extremely helpful) and
209 responses were evenly distributed (see web supplement: Fig 1).

210 Some women had very positive experiences of health service help: *'Help in maternity suite for first 7*
211 *days was outstanding'*. Sometimes women didn't ask for help or they did not receive help because they
212 started pumping after leaving hospital. However, others were shown once then *'left to get in with it'* or
213 *'had to figure it out myself'*. Others described *'conflicting advice'* or *'not enough realistic information'*.

214 Some mothers sensed that the health professionals didn't *'approve'* of pumping or *'expressing was*
215 *discouraged'*. Overall the comments indicated a lack of consistency of support for mothers to use
216 pumps. There was a suggestion that health professionals lacked knowledge or expertise about pumps
217 and pumping. Mothers described receiving help from a range of voluntary or non-health professional
218 groups, friends and family members.

219 *I have yet to meet an nhs professional that has any competent knowledge of breast pumps or*
220 *expressing breast milk (14004650 general comment about breast pumps).*

221 At the end of the survey participants were invited to add 'other comments or opinions about health
222 service provision of breast pumps, or advice and help with expressing breast-milk'. In this section there
223 were strongly expressed opinions that a pump hire service should be provided with face-to-face support
224 and/or further information, and several respondents commented on the importance of continued or
225 improved provision of breastfeeding support for both pump hire and a free pump to keep.

226 *Breast pumps can be useful when required ie premature baby, engorgement, mastitis etc but this*
227 *needs to come with correct information from a trained professional (14010576 - Free Pump)*

228 **Agreement with a free breast pump hire compared to providing a free breast pump to keep**

229 Women were introduced to the topic with a statement: 'A recent poll of people in the UK found that
230 provision of a free breast pump worth £40 was an acceptable incentive for breastfeeding women. We
231 are interested in hearing your views on this'. They were then invited to respond to the question: 'Do you
232 agree or disagree that a free breast pump, worth around £40, should be made available to breastfeeding
233 women for free on the NHS?' Net agreement with the provision of a free breast pump was 61.3%
234 (408/666) and net disagreement was 23.7% (158/666), Fig 2. Women were then invited to respond to:
235 'Some areas have a breast pump hire service for more expensive electric pumps. Do you agree or
236 disagree that a free hire service should be available for breastfeeding women for free on the NHS? Net
237 agreement was 85.1% (567/666) and net disagreement was 8.4% (56/666). In the UK context a free hire
238 is the same as a free rental or loan. The question asking about a free breast pump was derived from the
239 BIBS study (Morgan et al., 2015; Crossland et al., 2016).

240 *Figure 2: free breast pump hire service compared to providing a free breast pump worth around £40*

241
242 There were 408 and 309 free text comments to questions asking what participants thought about a free
243 pump or a free breast pump hire service respectively and these indicated a range of complex opinions.
244 There was general agreement for both the free pump and free pump hire service in principle (Fig 2) but
245 agreement was more mixed for providing a free pump to keep. Some preferred a hire service to a free
246 pump, some had the same agreement for both, with free text comments stating shared benefits or
247 concerns for both options. The comments relating to the two breast pump services, with a focus on new
248 findings relating to pump hire, are grouped into key themes: Potential for benefit; Risk and safety;
249 Service features; and Affordability, which are presented in the next section.

250
251 **Potential for benefit**

252 Many positive comments for both the pump hire and the free pump service were framed around
253 *'anything which helps a breastfeeding mother'* or more generally a *'great idea'*, *'invaluable service'* and
254 *'I've never thought about it. It could be a good idea for mums who are struggling to feed'*. More
255 specifically a free pump might help a mother keep breastfeeding if she is having difficulties, for example,
256 poor weight gain, a baby not latching or might enable her to have more time to herself and involve
257 others in baby feeding.

258 Support for the hire service related to the pump being a high quality hospital grade electric pump, which
259 was considered to be effective for managing early breastfeeding difficulties, maintaining milk supply in
260 the early days and weeks and helping women to continue breastfeeding once they returned to work.

261 The benefits from the hire service were often couched relative to a manual pump, which was considered
262 to be inferior:

263 *Manual breast pumps are ineffective (or at least in my experience) you pump for 20 minutes for*
264 *literally 10ml of milk which is exhausting. Access to the electric ones for all would be so much*
265 *better. (14039244- comment about Pump Hire)*

266 Others stated that they might have breastfed for longer or had a better feeding experience if a free
267 pump (to keep or hire) had been available and others who had obtained a pump (either through hire or
268 been given one) said it had '*saved their breastfeeding*' or '*they would have been lost without this*
269 *service*'. There was some support for the proposal that a free pump (keep or hire) might encourage
270 women to think about breastfeeding and so increase breastfeeding initiation. However, there were
271 more suggestions that it might increase continuation by helping women who were already
272 breastfeeding but '*find establishing breastfeeding a challenge*' or were struggling with '*real feeding*
273 *issues*' and might '*help eliminate the need for formula top ups*'.

274 **Risks and safety**

275 Risks and safety themes fell into three broad areas: pump provision would discourage health
276 professionals from helping women to breastfeed directly from the breast; the potential for adverse
277 consequences on breastfeeding outcomes; hygiene and misuse concerns

278 ***Dis-incentivising health professional support***

279 Perception of risk varied in response to whether the respondent preferred the pump hire or the pump
280 to keep. The main risk identified with both options was that it might '*disincentivise health professionals*
281 *from effective treatment of feeding issues*' as pumps could potentially be used to attempt to fix
282 problems which would be better managed by good professional support. Furthermore many
283 respondents suggested that any service to support breastfeeding should focus on providing actual face
284 to face support.

285 *Women need support and ACCURATE advice on breastfeeding, not a device to encourage bottle*
286 *feeding! (14032410 –Free Pump)*

287 ***Anxieties and confidence***

288 Adverse consequences related to concerns about using a free [hand] pump too soon and the effect on
289 women's confidence particularly if pumping was difficult or ineffective. Many of the mothers
290 highlighted concerns about early pumping stating that that pumping is not recommended until baby is 6
291 weeks.

292 *Thus will encourage pumping too early and may cause oversupply issues which can then be very*
293 *difficult to manage and have painful consequences such as blocked ducts and mastitis (14004776*
294 *–Free Pump)*

295 The potential effect on the mothers breastfeeding confidence of pumping only small amounts or none at
296 all or not '*get(ing) on with all or some brands of pumps*' was noted, particularly in relation to a manual
297 pump:

298 *Pumping unnecessarily can cause a mum to doubt her production, to question their milk supply,*
299 *cause nipple confusion, cause introduction to bottle unnecessarily and generally hinder a good*
300 *breastfeeding journey. (14070509 – Free Pump)*

301 Other perceived risks included pressure on mothers to express, expressing replacing breastfeeding or
302 increased bottle feeding and pumping being exhausting.

303 *Breastfeeding/expressing doesn't suit everyone. This might put more pressure on those who feel*
304 *they can't breastfeed. (14005732 – Free Pump)*

305 ***Hygiene and misuse concerns***

306 Concern about shared equipment was raised with respect to the pump hire service. A *'pump that maybe*
307 *someone else has used'* or *'concerns about hygiene'* might make the service unpopular.

308 *'I wouldn't even consider it unless a new pair of shields and tubes was given to every mum*
309 *because even sterilising parts of a breast pump doesn't get it clean'* (14210270 –Pump Hire)

310 There were concerns about the potential for misuse of both the free pump and the hire service,
311 including mothers taking a pump but not using it or *'selling pumps on EBay'* (global on-line marketplace).
312 Hire pumps might not be looked after, returned damaged or not returned at all. Free pumps would
313 contribute to landfill. Some suggested that a deposit should be taken to ensure return.

314 **Pump service features**

315 Included in this section are opinions on what might make a pump service more acceptable such as
316 targeting certain population groups, recommendations about pump type and vouchers.

317 **Target population:**

318 Some women felt that all women and babies could benefit from a free pump to hire or keep. Other
319 respondents had fairly consistent views over who should be able to access a free pump, mainly women
320 who either couldn't afford a pump or who had a clinical need for a pump, for example a sick mother or
321 baby, *'mums who are having breastfeeding problems or have babies in SCBU [neonatal unit]'*.

322 *Perhaps not available to everyone but definitely to those on a lower income. My breast pump*
323 *cost in the region of £100 which not everyone can afford.* (14005388 - Pump Hire)

324 The suggestions about targeting specific people was sometimes founded on concerns that a universal
325 service could be interpreted as indicating that a pump was essential for breastfeeding.

326 *BUT! I worry that if it was simply given as standard, it would give the impression that*
327 *breastfeeding REQUIRED a pump and this is just not the case. Breastfeeding should be seen as*
328 *easy and not requiring all the "stuff" that bottle feeding requires. (14015484 - Free Pump).*

329 Respondents also thought that later access to the service might help prolong breastfeeding when
330 mothers returned to work. There was less support for pumps being used to enable social activities, such
331 as 'nights out'.

332 ***Personal choice, quality of the pump and cost***

333 Many mothers had concerns about a single pump option and suggested that women should be offered
334 choice, as '*one size doesn't fit all*'. Others suggested that a pump hire service might provide an
335 opportunity to *have a few different pumps for women to try before purchasing one*, which several
336 related to their experience of trying several pumps before they found one that suited.

337 The costs of the different types of pump was often mentioned in relation to quality and personal choice
338 Opinions about providing a £40 free pump varied: for some it was too expensive and others thought it
339 was too cheap, would be of poor quality and ineffective. Comparisons between manual and electric
340 suggested that £40 might not get a good electric pump but might be enough for a hand pump. For
341 feeding sick/preterm neonates or more long-term pumping there was support for a more expensive
342 'hospital grade' electric pump such as might be provided through the hire service.

343 *It really depends on the type and quality of the breastpump. Good quality ones are easier and*
344 *more effective to use. If they're not mums tend to give up on them more quickly. A breast pump*
345 *loan scheme/bank might work better. (14029919 – Free Pump)*

346 In agreeing with a breast pump hire service many respondents highlighted concerns about the cost of
347 either purchasing or hiring a good quality pump. Although some respondents suggested that purchasing

348 or hiring a pump was inexpensive and cheaper than the cost of infant formula in the long run, most
349 indicated that breast pumps are expensive to buy or hire. Some had spent over £200 on a pump and
350 high quality pumps may be unaffordable for many:

351 *I got a second hand one from eBay as I couldn't afford a brand new one! (14068719 – Pump*
352 *Hire)*

353 Some women related their own experiences where they had bought a cheap pump which had broken or
354 had spent a lot of money on a good quality pump but had given up breastfeeding soon after. Hiring a
355 pump was also '*quite expensive*' especially for those who ended up expressing for some time. Given the
356 expense some mothers suggested that the hire service would provide an opportunity to try '*a few*
357 *different pumps for women to try before purchasing*' either to help with choice or to find out if pumping
358 was going to work for her.

359 **Access: vouchers, fees and deposits**

360 The importance of choice and flexibility for accessing a free pump was reflected in several suggestions of
361 providing a voucher that the mother can use towards buying a pump or pump hire.

362 *Good pumps cost money so perhaps a voucher towards a pump may be better? Then mum has a*
363 *choice over which pump she can have. (14067463 – Free Pump)*

364 In contrast, some respondents who rejected a universal free service suggested that pump hire access
365 should be via a deposit, or small fee or that some form of subsidy should be provided. This seemed to be
366 based on a consideration of the expense of either purchasing or hiring an electric pump and the cost of
367 buying infant formula. Specific circumstances as highlighted above (financial or medical need) should
368 qualify for a free pump but there was support for other mothers being able to have access for a small
369 charge or donation:

370 *I don't think this should be a free service. Available at a small hire cost would be acceptable to*
371 *most. (14378299 – Pump Hire)*

372 **Wider affordability and implications**

373 Comments about the wider societal costs of providing a free pump or pump hire service were stated in
374 relation to, the costs to the NHS of supplying a service and potential environmental impact.

375 Respondents expressed a range of views regarding the cost implications for the NHS relating this to their
376 perception of the general affordability of buying or hiring a pump. Many respondents observed that the
377 NHS was '*already in a bad financial situation*' and would not '*have the resources for this*' while others
378 thought that this should be provided as money would be saved elsewhere '*as in the long run increasing*
379 *breastfeeding rates will save the NHS money*'. One respondent questioned why money should be spent
380 on some things but not on others.

381 *I've had difficulty with BF and only continued through use of free hospital quality pump without*
382 *it I couldn't afford the monthly fee. - smokers can get free patches on NHS to help them heroin*
383 *addicts get methadone to help them so why can't we get pumps to help us!! (14064532 - Free*
384 *Hire)*

385 Several suggested that rather than providing pumps, '*spending the money on better support networks*
386 *would be more beneficial*'. Some of the discussion around NHS funding related to a consideration of
387 whether a breast pump was essential to breastfeeding and opinions on this were contradictory. Some
388 respondents suggested that '*pumping is not an essential and the NHS needs to spend it's money on*
389 *essentials.*' However, others argued that pumps were essential '*for women who is struggling*'.

390 **Discussion**

391 Both a free breast pump to keep or a free pump hire service are agreeable interventions to an on-line
392 sample of women who have recently breastfed and have experience of using a breast pump. Being able

393 to access a free pump has the potential to prolong breastfeeding by helping women manage feeding
394 challenges. Some women may not be able to afford to buy a pump and a pump could enable an infant to
395 be fed breast-milk while maintaining mothers' milk supply. This could provide the option for women to
396 continue to breastfeed for longer than they might have done if they could not access a free pump.
397 However, there were a number of concerns including free pumps displacing professional support, a
398 pump being viewed as a necessity and anxieties about the practicalities including hygiene. There were
399 contrasting views about how a service might be provided: to maximise choice and flexibility through
400 providing vouchers for pump hire or purchase; restricting access to those most in need; a subsidised
401 service with fees and deposits. The cost of a high quality pump was seen as prohibitive and some
402 women wanted to try a pump prior to buying in case it did not suit them.

403
404 Support for free access to breast pumps was based on the assumption that this will enable more women
405 to breastfeed for longer and so in the long run save the NHS money. However, while increasing
406 breastfeeding would improve health and save the NHS money (Renfrew et al, 2012) there is no good
407 evidence for the impact of pumps on breastfeeding rates among healthy term infants. In order to gain
408 the robust evidence required, there would be a trade-off for countries where health services are publicly
409 funded, like the UK NHS, as the public would be paying up front for the pump service but would also
410 reap any benefits if the service is effective at improving breastfeeding and health outcomes. Few studies
411 have evaluated the effects of providing a free pump (Moran et al., 2015) or of expressing breast milk
412 (Becker et al., 2016) on breastfeeding initiation or duration among mothers of term healthy infants.
413 There is some evidence associating exclusive expressing with shorter breastfeeding durations (Pang et
414 al., 2017; Keim et al., 2017, Jiang et al., 2015). However, the evidence for the effect of combining direct
415 breastfeeding and breast milk expressing is inconsistent (Geraghty et al., 2012, Jiang et al., 2015, Winn
416 et al., 2006) with variable impact depending on the age of the baby (Schwartz et al., 2002), frequency of

417 expressing or the reasons for expressing (Felice et al., 2016). For example, many women use pumps or
418 infant formula supplements to deal with feeding difficulties (Forster et al, 2015; Felice et al., 2016). In
419 our study women said that pumps resolved difficulties and 'saved their feeding' or access might have
420 helped them to breastfeed longer, confirming findings from our earlier study on the acceptability of
421 breast pumps as an incentive for breastfeeding (Crossland et al., 2016). It would be important to include
422 reasons for pump use in future evaluations of a free pump service.

423 Mothers' experience of being advised to avoid pumps before six weeks reflects guidance for current
424 practice for hand expressing in the early days for mothers of term healthy infants (UNICEF), however
425 there is no strong evidence to underpin this (Becker et al., 2016; Johns et al., 2013; Forster et al., 2015).
426 Mothers of preterm or sick infants in neonatal units are offered electric pumps immediately to maximize
427 the health benefits of early breast milk provision (UNICEF, NICE, 2006) which had the potential to give
428 mixed messages to women, especially those who had personal or vicarious experience of this. The
429 difference in effectiveness of different pumps at different stages of lactation requires further
430 investigation.

431

432 Some of the appeal of a pump hire service was the potential to access a high quality hospital grade
433 electric pump, which was seen as more likely to be effective and reliable when compared to cheaper
434 electrical or manual pumps. This reflects findings from a longitudinal qualitative study of milk expression
435 in the US, which found that mother's preferred high quality electric pumps as these enabled quick and
436 efficient expressing compared to manual pumps which were viewed as slow, ineffective and potentially
437 wasteful (Felice et al., 2017). However, there is limited evidence to support the need for a hospital grade
438 pump. The most recent Cochrane Review (Becker et al., 2016:p2) concluded that 'low cost interventions
439 including ... low cost pumps may be as effective, or more effective, than large more costly electric

440 pumps for some outcomes'. Our findings fit with those of Meier (2016) and the Cochrane review (Becker
441 et al., 2016) who recommend that the method of expressing and choice of pump should be tailored to
442 the mother's reasons for expressing, degree of pump dependency and stage of lactation or age of infant.
443 Thus a completely pump-dependent mother (e.g. very preterm infant or choice to exclusively pump)
444 would require a hospital grade electric pump for effective milk removal and maintaining milk supply. In
445 addition, a hospital grade pump may be important during the crucial initiation phase in other situations
446 such as late preterm infant or health problems (Meier, 2016). The use of manual pumps during the early
447 postnatal period was highlighted as a concern as in our earlier study (Crossland et al., 2016). Although
448 the majority of our survey respondents had healthy term babies, there was a preference for high quality
449 electric pumps and this may explain why hire was preferred over a £40 pump to keep. It should be noted
450 that most research around expressing and pump use focuses on sick or preterm infants and may not
451 fully translate to mothers of healthy term infants who were the main group responding to our survey. A
452 further limitation of the evidence is that some studies declare conflicts of interest, in that they have
453 been funded by pump manufacturers.

454
455 Health inequalities due to the expense of buying a breast pump for women with reduced income, in
456 addition to the costs associated with a new baby, have been highlighted (Crossland et al., 2016). In our
457 study this concern extended to the ability of the NHS to afford to provide a free pump hire service. This
458 is likely to reflect current perceptions and media coverage relating to the scarcity of NHS resources, and
459 some argued that the NHS should only provide essential items. Conversely others recognized the
460 potential to extend breastfeeding through providing more choices or resources and the subsequent
461 health benefits and cost savings that may ensue (Renfrew et al 2012). In our survey women suggested
462 ways to offset cost including limiting the target population or charging women either a small fee or

463 donation. Concerns about gaming any incentive system e.g. selling on eBay are consistent with those
464 reported in the BIBS study (Morgan et al, 2015, Crossland et al, 2016).

465

466 STRENGTHS AND LIMITATIONS

467 This on-line survey recruited mothers who are interested in expressing breast-milk and using breast
468 pumps. To our knowledge this is the first reported data on women's perspectives on a proposed breast
469 pump hire service. The larger than expected sample for an on-line survey disseminated via social media
470 and high volume of free text comments demonstrates the importance and interest in the topic of
471 developing a breast pump service to meet the needs of women. The rich free text comments improve
472 our understanding of women's perspectives. However, the snowball sampling method via social media
473 (Noy, 2008) is likely to recruit women with similar opinions and is more likely to reflect the views of
474 mothers with a particular interest or perspective in the topic (Waters, 2015). The sample was older than
475 the general population of women giving birth in Scotland (ISD 2017b) and did not include women who
476 provided no breast milk to their infants, or who breastfed but did not express or use a pump. It is
477 therefore not representative of the mothers from lower socio-demographic groups who are also least
478 likely to breastfeed. The nature of an on-line survey, like any other survey, doesn't indicate who actually
479 completed the forms. It is possible that some women may have completed the survey more than once,
480 although this is unlikely to have occurred often, due to the observed diversity of responses and free text
481 comments. We did not collect data on actual age of infants/children and relied on women reading the
482 eligibility statement at the start of the study. Neither did we collect data on how much time had elapsed
483 since women's last experience of using a pump. This could be relevant as the choice of pumps available
484 has increased rapidly in recent years. We did not ask about how the service would be funded as our
485 previous study found that the offer of a free breast pump was more acceptable to the tax paying general
486 public than shopping voucher incentives for breastfeeding (Morgan et al,2015). Sensitive data on

487 income and employment status was also not collected, as it was considered a risk to recruitment in the
488 UK context at the time of the survey. Our intention was to keep the survey short and focused on
489 women's views to maximize response rate. The option to target paper copies at specific groups was
490 beyond the resources we had available. The aim was to inform the design of a complex intervention to
491 provide free pump access, which in theory could address important health inequalities evident in the
492 women who choose and succeed with breastfeeding. However, the potential impact of a free breast
493 pump service on younger women and less privileged women who are known to be less likely to
494 breastfeed remains uncertain.

495

496 SUMMARY AND RECOMMENDATIONS

497 A free breast pump service is an agreeable intervention for women who have experience of
498 breastfeeding and using a pump, and women would support further service development. Preference
499 was for access to a free pump hire (rental or loan) service provided flexibly according to women's need,
500 with a choice of pumps alongside good quality woman-centred help and support from health
501 professionals. The differing opinions on perceived risks and benefits highlight the importance of
502 involving mothers in service development. It is clear that a "one size suits all" approach to service
503 provision may not be acceptable. Further study is needed to determine the impact of timing and use of
504 pumps on breastfeeding duration in term infants. Current services are not providing effective or
505 satisfactory help and advice for women who wish to use pumps. There are also conflicting views about
506 baby feeding that do not fit with current evidence or women's wishes. Development of a free pump
507 service with women in the target population should address the issues raised in this survey. A new free
508 breast pump service is a potentially acceptable intervention to help women to continue to breastfeed
509 for longer.

SURVEY TOOL

A recent poll of people in the UK found that provision of a free breast-pump worth £40 was an acceptable incentive for breastfeeding women. We are interested in hearing your views on this. We are also interested in hearing about your experiences of feeding your baby.

1. Do you agree or disagree that a free breast-pump, worth around £40, should be made available to breastfeeding women for free on the NHS? Required

Strongly agree

Tend to agree

Neither agree nor disagree

Tend to disagree

Strongly disagree

Please add any comments or opinions that you have on this idea

2. Some areas have a breast pump hire service for more expensive electric pumps. Do you agree or disagree that a free hire service should be available for breastfeeding women for free on the NHS? Required

Strongly agree

Tend to agree

Neither agree nor disagree

Tend to disagree

Strongly disagree

Do you have any comments or suggestions about this?

3. Have you ever expressed breast-milk for your baby? Required

- Yes
- No

[Anyone answering No is routed to Question 10: About You]

[NEW PAGE]

4. Have you ever used a breast pump? Required

- Yes
- No

[Anyone answering No is routed to Question 10: About You]

5. What type of breast pump do/did you use? Required

- Hand operated / manual pump only
- Electric pump only
- Both hand/manual and electric pumps

5a. Could you tell us the reasons for your choice of pump(s)

5b. Please name the pump(s) you have used or are currently using?

6. How old was your baby when you first used a breast pump? (If you have used a breast pump for more than one of your children, please answer for the most recent child) Required

- 0 to 2 days old
- 3 to 7 days old
- 8 to 14 days old
- 15 days up to a month old
- 1 to 2 months old
- Older than 2 months
