## Supplementary Information:

### Alternative analyses of the delay-discounting task with area under the curve (AUC) and normalized AUC

There is a debate in the preclinical literature on impulsivity about the best way to analyze impulsivity using delay-discounting curves (the two debated options are curve-fitting approaches or to compute the area under the delay-discounting curve). In addition to extracting the  $k$  parameter (see Methods section) we have also computed the AUC (normalized and non-normalized). When using these AUCs as input variables, the clustering approach was inadequate as it created two groups with a very unequal number of animals, even after removing two outliers (see SI Fig.1). In spite of this, the correlation obtained for *Cnr1* and the  $k$  parameter had an equivalent correlation between both the AUC (Magnard et al., 2018) and the normalized AUC (Myerson et al., 2001), with or without two identified outliers, and *Cnr1*, supporting the robustness of our results.

SI. Fig 1. The relationship between *Cnr1* gene expression and impulsive behavior measured (alternative analysis)

Impulsive choice was positively correlated with impulsivity measured by both measures of AUC, with or without outliers (a smaller AUC indicates a faster switch in the preference in favor of the immediate lever i.e. higher impulsivity) A) Impulsive choice (as defined by the normalized AUC, without removing outliers) was positively correlated with *Cnr1* (CB<sub>1</sub> cannabinoid receptor) gene expression in the mOFC (Kendall's  $\tau=-0.584$ ;  $p=0.02$ ). B) Impulsive choice (as defined by the AUC, without removing the outliers) was positively

correlated with *Cnr1* (CB<sub>1</sub> cannabinoid receptor) gene expression the mOFC (Kendall's  $\tau$ -0.629=; p=0.012). C) Impulsive choice (as defined by the normalized AUC without the two outliers) was positively correlated with *Cnr1* (CB<sub>1</sub> cannabinoid receptor) gene expression the mOFC (Pearson's  $r$ =-0.747; p=0.033). D) Impulsive choice (as defined by the AUC without the outliers) was positively correlated with *Cnr1* (CB<sub>1</sub> cannabinoid receptor) gene expression in the mOFC (Pearson's  $r$ =-0.740; p=0.036).

SI Table 1. Primer sets used for RT-qPCR amplification.

Gene	Description	Forward primer	Reverse primer
<i>Grin1</i>	glutamate ionotropic receptor NMDA type subunit 1	AACCTGCAGAACCGCAAG	GCTTGATGAGCAGGTCTATGC
<i>Grin2a</i>	glutamate ionotropic receptor NMDA type subunit 2A	TGTGAAGAAATGCTGCAAGG	GAACGCTCCTCATTGATGGT
<i>Gria1</i>	glutamate ionotropic receptor AMPA type subunit 1	AGAGGCTGGTGGTGGTTGACT	ACCCTGGTATGGTCTCGGGA
<i>Gria2</i>	glutamate ionotropic receptor AMPA type subunit 2	GGCGTGTAATCCTGGACTGT	ACACCAGGGAATCGTCGTAG
<i>Gabrg2</i>	gamma-aminobutyric acid type A receptor gamma 2 subunit	CGGAAACCAAGCAAGGATAA	ACAGTCCTTGCCATCCAAAC
<i>Gabrd</i>	gamma-aminobutyric acid type A receptor delta subunit	GCTGGACCTGGAGAGCTATG	CCGAAGCTGGAAGGTAAAGC
<i>Gabra1</i>	gamma-aminobutyric acid type A receptor alpha 1 subunit	TTGACTGTGAGAGCCGAATG	AAACGTGACCCATCTTCTGC
<i>Gabra2</i>	gamma-aminobutyric acid type A receptor alpha 2 subunit	CCATGCACTTGGAGGACTT	ACTGGCCCAGCAAATCATAC
<i>Cnr1</i>	cannabinoid receptor 1	GTCGATCCTAGATGGCCTTGC	GTCATTGAGCCCACGTAGAG
<i>Dagla</i>	diacylglycerol lipase, alpha	CTTTGCTGAATTTTCCGTGACC	TTGTTTGCCTCATCCAGCAC
<i>Mgll</i>	monoacylglycerol lipase	CTACCTGCTCATGGAATC	GACACCCACGTATTTATTTTC
<i>Napepld</i>	N-acyl phosphatidylethanolamine phospholipase D	AGATATGGACTCAAGAGTGAAGACTTC	TCCTCAAAGGCTTTGTCATCGG
<i>Faah</i>	fatty acid amide hydrolase	GTTACAGAGTGGAGAGCTGTCC	GTCTCACAGTCGGTCAGATAGG
<i>Gapdh</i>	glyceraldehyde-3-phosphate dehydrogenase	TCCCTGTTCTAGAGACAG	CCACTTTGTCACAAGAGA
