LETTER TO THE EDITOR

Elite football of 2030 will not be the same as that of 2020: What has evolved and what needs to evolve?

Damian J. Harper¹, Gareth N. Sandford^{2,3}, Jo Clubb⁴, Megan Young⁵, Matt Taberner⁶, Dave Rhodes¹, Chris Carling⁷ and John Kiely¹.

¹ School of Sport and Health Sciences, University of Central Lancashire, Preston, UK

² School of Kinesiology, University of British Columbia, Vancouver, BC, Canada

³ Canadian Sport Institute-Pacific, Victoria, BC, Canada

⁴ Buffalo Bills, Buffalo, USA

⁵ Chicago Red Stars, Chicago, USA

⁶ School of Sport and Exercise Sciences, Liverpool John Moores University, Liverpool, UK

⁷ Centre for Elite Performance, French Football Federation, Paris, France

Correspondence:

Damian J. Harper, School of Sport and Health Sciences, University of Central Lancashire, Preston, PR1 2HE, UK. Email: dharp5@uclan.ac.uk

Conflict of interest:

None to declare

Authors Contributions:

DJH drafted the original paper. GNS, JC, MY, MT, DR, CC and JK were involved in drafting the manuscript and revising it critically. All authors have given approval of the final version to be published.

9 *complexities of the adaptive response, the nature of the training stimulus and its assessment.*¹

10
11 — Prof. Tom Reilly
12

13
14 We read with interest the recent editorial by Nassis et al² on future demands of elite football.
15 Here we add to this evolving conversation by providing some practical considerations around
16 the future physical preparation of elite players for high-intensity locomotor demands not
17 explicitly addressed in the editorial. We also feel that women's football should feature in this
18 discussion, given its rapidly growing profile and professionalism³, while evidence from the
19 2015 and 2019 women's World Cups illustrates that high-intensity running demands could be
20 increasing at a greater rate than men's.³
21
22

23
24 Whilst we agree with Nassis et al² that the future game will be played at higher speeds, it is
25 important to note that the English Premier League study⁴ used by the authors² to forecast
26 increases in high-intensity running used absolute high-speed running and sprinting zones.
27 Importantly, for the purposes of accurately informing the preparation of elite players, these
28 arbitrary high-intensity running thresholds do not capture accelerations or decelerations,
29 reflect the relative proportion of an individual's anaerobic speed reserve (ASR), nor consider
30 individual player movement, tactical and technical demands that are important for position
31 specific training⁵ and rehabilitation.⁶
32
33

34
35 We suggest that tactical evolutions of the future game, predicated on models of high-intensity
36 pressing, counter pressing, and counterattacking, will result in greater exposure to intense,
37 short accelerations and decelerations, interspersed between more high-speed running
38 moments.⁶ Accordingly, the creation of high-intensity locomotor profiles may be especially
39 insightful for individualizing load demands and accurately informing training prescriptions
40 (Figure 1). Such a profile could include maximal: (1) acceleration, (2) deceleration (3)
41 maximal aerobic speed (MAS) and (4) maximal sprinting speed (MSS) metrics — with the
42 latter two components enabling evaluation of anaerobic speed reserve. Clearly, although
43 beyond the scope of this letter, future players will also require concurrent improvements in
44 high-speed decision-making skills.

1
2
3 We see the locomotor profile having the biggest impact on physical preparation and
4 performance through:
5
6
7

- 8 1. **Raising the ‘ceiling’:** Advanced field-based profiling will identify individual specific
9 training needs enabling the ‘ceiling’ to be raised in each high-intensity locomotor
10 skill through individualized training. Raising the ‘ceiling’ will improve player
11 capacity to repeat and recover from dense high-intensity running loads.
12
- 13 2. **Braking performance capabilities:** The development and refinement of deceleration
14 metrics, and the design of corresponding training interventions, will enhance braking
15 performance capabilities, facilitating game-specific speed abilities and reduced pre-
16 disposition to fatigue and injury.
17
- 18 3. **Precision monitoring:** Small embedded micro-technologies will provide advanced,
19 *in-situ*, precise physiological and mechanical insights into high-intensity locomotor
20 performances. Such data, when analysed using evolving machine learning algorithms,
21 should provide information to more accurately inform coaching, sport science and
22 medicine practitioner’s decision-making processes.
23
- 24 4. **Precision loading:** New technologies will enable precise loading of specific force-
25 velocity components required for each high-intensity locomotor skill. For example,
26 portable motorised electronic systems can be used to create assisted and resisted
27 player specific acceleration, deceleration and MSS training prescriptions.
28
29
30
31
32
33
34

35
36 In summary, the future game will demand an increasing priority on ‘individualization’. We
37 offer the locomotor profile as a key tool that may help us navigate the complexity of future
38 game demands.
